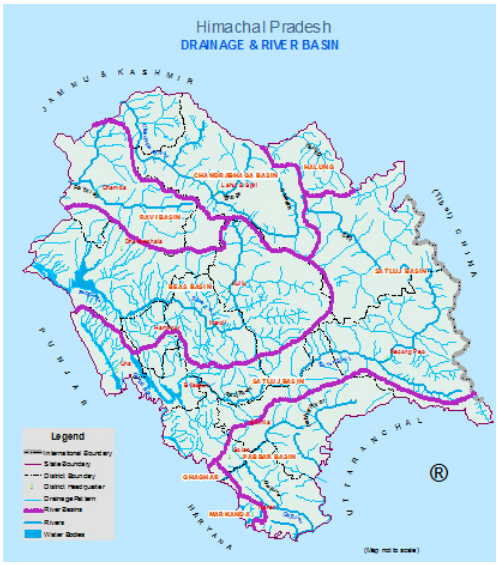
Introduction

1. Introduction

Located in North India, Himachal Pradesh (HP) is a small mountainous state bordering Punjab, Haryana, Uttarakhand, and Jammu and Kashmir. Himachal is a relatively small state and in 2011 its population stood at 68.65 lakhs. It is only 9% urbanised and most of Himachal lives in its villages. Of the total land geographical area only 10% is under agriculture while close to 70% in under the category of 'Forest land'. And yet agriculture is the main source of livelihood in Himachal with over 93% of the population dependent on it. As in most mountain areas agriculture and forest dependence is interwoven.



Agriculture is made possible due to the irrigation from river channels or natural springs. The health of the forests directly determines the health of the surface and ground water systems which in turn determines the viability of agriculture and horticulture. Horticulture and cash based agriculture was pushed by the government in the late 70s and 80s. Today the state has massive apple cultivation, apart from commercial vegetable cultivation, which is an important source of income for the farmers.

Himachal Pradesh a mountain state in Indian Himalaya, covering an area of over fifty five thousand square kilometres, has 5 major river basins Satluj, Ravi, Beas, Chenab and Yamuna. Yamuna crosses only the south-eastern border of the state, and but its tributaries originating in Himachal include Giri and Tons which form a part of the Ganga river basin flowing westward. The other four rivers are major tributaries of the eastward flowing Indus River, the longest in the world (2000 miles or 3200 kilometres) with a flow twice the size of the Nile. The Indus becomes a much larger river once it is joined by what are known as the 'Punjab' (literally meaning 5 rivers – Satluj, Ravi, Beas, Chenab and Jhelum).

Of the four Himachal Rivers, except Satluj which has its source in Tibet, the rest originate within the boundaries of the State of Himachal Pradesh. While the Satluj meets Beas meet within India, it joins the Chenab in Pakistan. Ravi too joins the Chenab in Pakistan. Chenab then goes on to meet the Jhelum and then the merged rivers meet the Indus at Mithankot in Pakistan followed by its confluence with the Arabian Sea. Himachal's unique geography and variation in altitude produces a wide spectrum of climates from hot and sub-humid tropical in the southern tracts to cold, alpine and glacial in the northern and eastern mountain ranges. There is a vast diversity of communities that reside in this landscape.

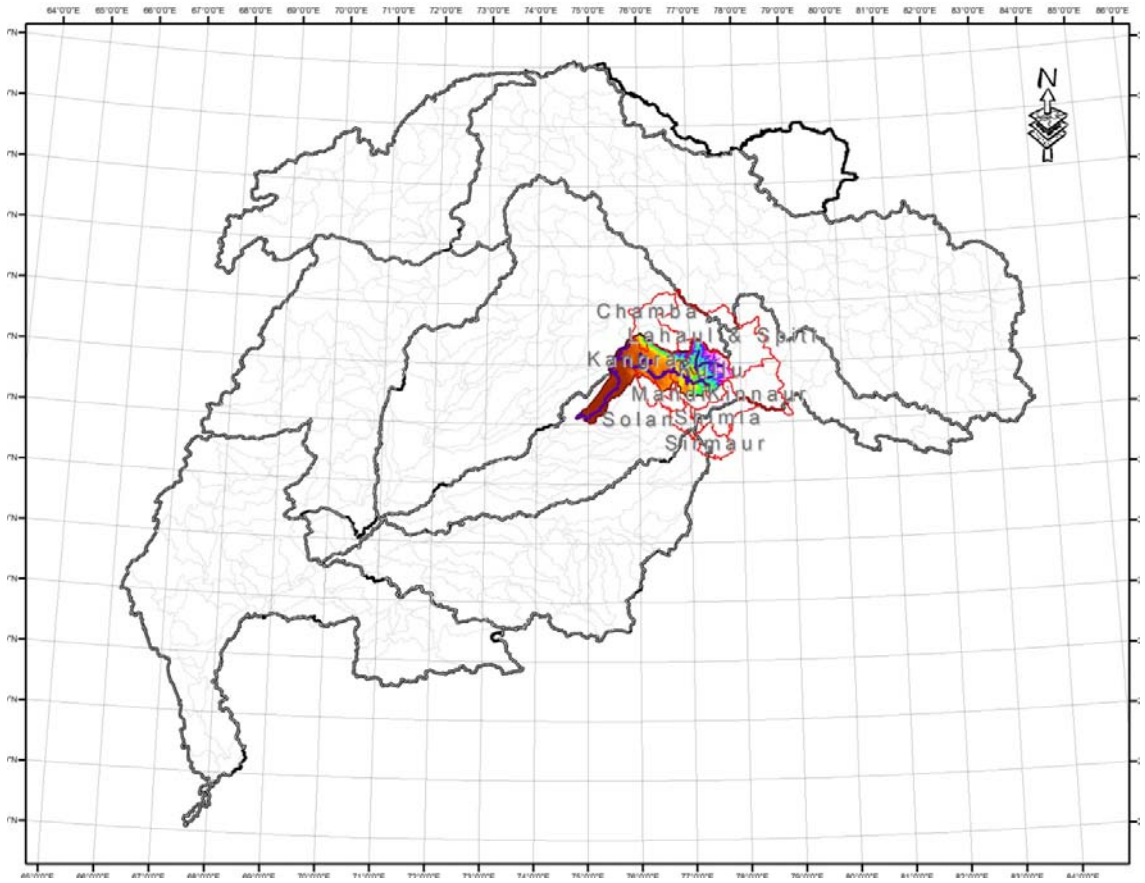
While the large rivers are referred to by them locally as dariya, their tributaries (glacial and snow fed) are smaller rivers are called khad, and smaller streams are known as nallahs. The, khads and nallahs, are critical components of the riverine ecosystem, even from the point of view of the local communities, who have a direct relationship with these for their day to day use – drinking water, irrigation, running watermills and fishing. It is rare to find communities residing very close to the larger rivers or dariyas, except in some parts of Lahaul-Spiti or then lower down in the valleys.

1. 1 Project Details

There are five river basins in the State contributing to Indus & Ganges river basins. These five river basins are Beas, Satluj, Yamuna, Ravi & Chenab. The major activity under this knowledge cell is to map and analyse small watershed of river basin scale using Hydrological modelling to simulate the quality & quantity of surface and ground water, to predict the environmental impact of land use management practices & climate change. The climate change vulnerability assessment using Micro

watershed approach is useful in assessing soil erosion prevention and control in regional management of watershed. Based upon the assessment of climate change vulnerability the micro watershed based climate change adaptation plan framework at village/panchayat level is to be formulated and developed which will be further useful for formulating all developmental plans at regional level.

Beas River Basin - Indus River Basin



Map 1.1: Indus River System

This activity is an accomplishment of the objective of undertaking climate change vulnerability analysis of all the river basins of the State of Himachal Pradesh. The major tasks to be undertaken through the present assignment as follows:

Activity 1 Micro watershed, hydrological modelling based vulnerability analysis of the Beas river basin

Activity 2 Preparation of district wise indicative adaptation plan framework.

2

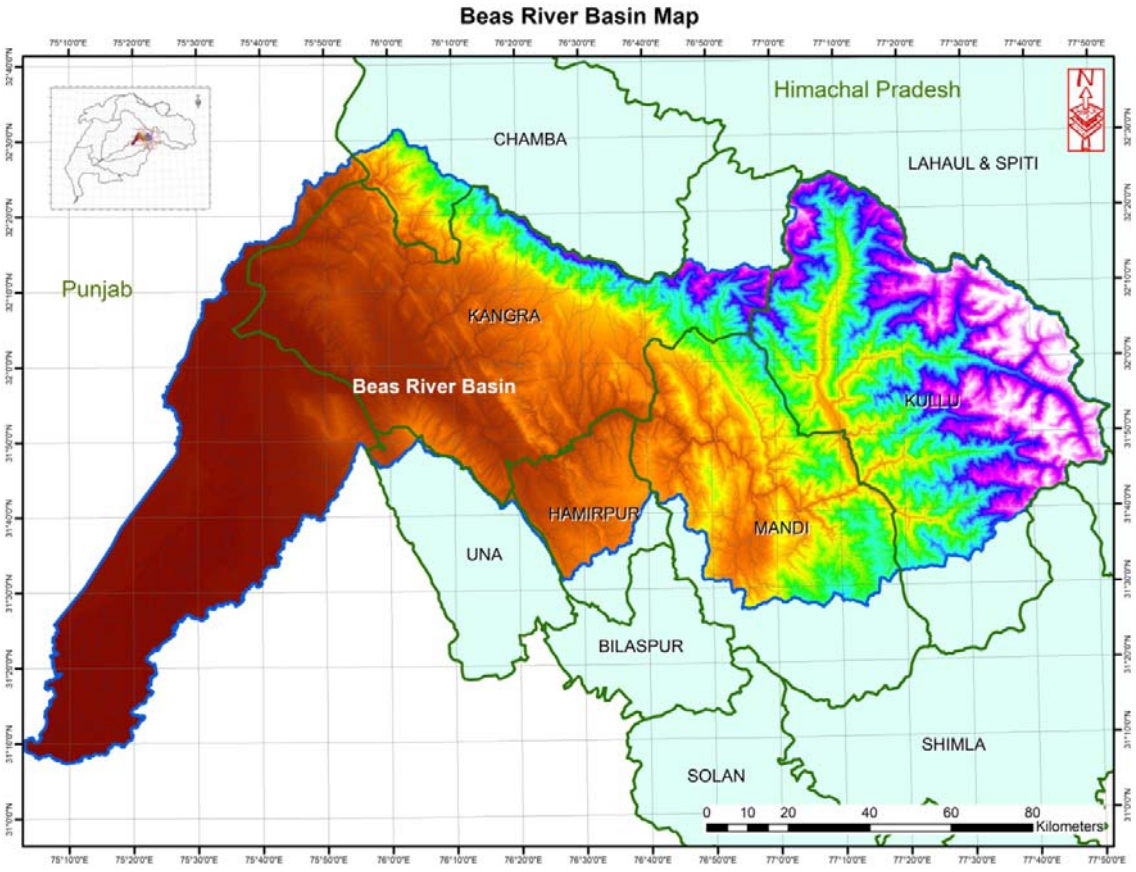
Beas River Basin: District Kangra

2. Beas River Basin: District Kangra

2.1 Beas River Basin - Profile

The Beas River is one of the five major rivers of Himachal Himalayas, flowing for approximately 470 km before joining the Sutlej River. Soils in the catchment are young and relatively thin, with their thickness increasing in the valleys and areas with gentle slopes (Pandey, 2002).

The major land cover classes include forest, snow and bare rock, with about 65% of the area covered with snow during winter (Singh and Bengtsson, 2003). The Beas catchment is under the influence of western disturbances that bring snowfall to the upper sub-catchment during winter (December-April), whilst the monsoon provides around 70% of the annual rainfall during June - September.



Map 2.1 Beas River Basin

The catchment is characterised by moderate – low temperatures with mean minimum and mean maximum winter temperatures of -1.6°C and 7.7°C, respectively (Singh and Ganju, 2008).

The river rises 4,361 metres (14,308 ft.) above sea-level on the southern face of Rohtang Pass in Kullu at Beas Kund. It traverses through Mandi, Hamirpur Districts and enters the Kangra District at Sandhol, 590 metres (1,940 ft) above sea-level.

During its lower course the River Beas is crossed by numerous ferries, many of which consist of inflated skins (darais). Near Reh in Kangra District it divides into three channels, which reunite after passing Mirthal, 300 metres (980 ft) above sea-level. On meeting the Shivalik Hills in Hoshiarpur, the river sweeps sharply northward, forming the boundary with Kangra District.

Then bending round the base of the Shivalik Hills, it takes the southerly direction, separating the districts of Gurdaspur and Hoshiapur. After touching the Jalandhar district for a short distance, the river forms the boundary between Amritsar and Kapurthala.

Finally the River Beas joins the river Sutlej at the south-western boundary of Kapurthala district of Punjab after a total course of 470 kilometres (290 miles). The chief tributaries are Bain, Banganga, Luni and Uhal. The Sutlej continues into Pakistani Punjab and joins the Chenab River at Uch near Bahawalpur to form the Panjnad River; the latter in turn joins the Indus River at Mithankot.

The total catchment area of the Beas River Basin is about 20,303 km^2. However, the catchment area, upstream of the Pong reservoir, is around 12,560 km^2. The catchment areas of the river covers 4 districts i.e. Kullu, Mandi, Hamirpur & Kangra.

The climate change vulnerability assessment study will cover district Kangra out of four districts:

2.2 Kangra District: At a Glance

Geographical features		
i)	Latitude	31° 41' 0" and 32° 28' 05" in north latitudes
ii)	Longitude	75° 35' 34" and 77° 04' 46" in east longitudes
iii)	Geographical Area	577681 Hectares
Administrative Units		
i)	Sub divisions	8
ii)	Tehsils	17
iii)	Sub-Tehsil	4
iv)	Patwar Circle	519
v)	Panchayat Simitis	7
vi)	Nagar Palika	4
vii)	Gram Panchayats	760
viii)	Revenue villages	3868
ix)	Assembly Area	16
x)	Development Blocks	15
Population		
i)	Male	7,48,559
ii)	Female	7,58,664
iii)	Rural Population	12,66,745
iv)	Density of Population	263
Land Utilization/Use		
i)	Total Area	577681 Ha.
ii)	Forest cover	180541 Ha.
ii)	NonAgriculture Land	360009 Ha.
v)	Cultivable Barren land	12553 Ha.
Forest		
(i)	Forest	183779 Ha.
Livestock & Poultry (2007 Census)		
i)	Cows	380501
ii)	Buffaloes	156094
i)	Goats	197151
ii)	Pigs	538
iii)	Dogs & Bitches	48911

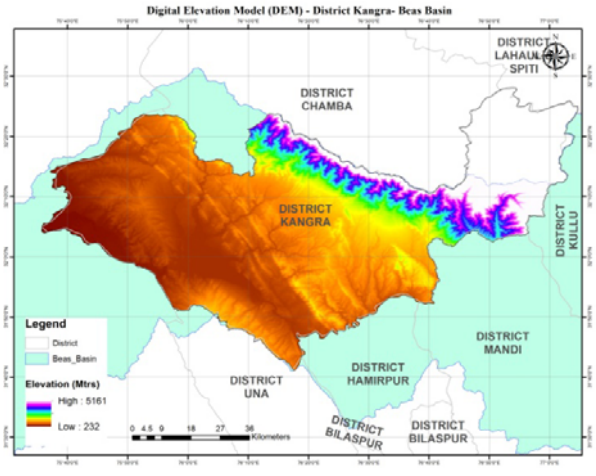
2.3 Socio-economic and Physical Aspect of Kangra District

Kangra is a town in Kangra District of Himachal Pradesh state in northern India, and lends its name to the district of the same name. Kangra was called Nagarkot in ancient history. It is a town at the confluence of the Bener River and Majhi River. The headquarte of the district is in Dharamsala which is also a tourist spot and is now home-in-exile to the Dalai Lama. Another important town is Palampur which is 40 kms away from Dharamsala and famous for its picturesque tea gardens. Many ancient temples like the Jawalaji Temple, Brijeshwari

temple, Cahamunda temple, Baba Baroh and Baijanith temple are found here. Kangra fort is also a popular tourist attraction.

2.4 Physiography

Kangra district forms a north-western part of the Himachal Pradesh. Kangra district is bounded in the north by Chamba district, on the north-east it touches Lahul & Spiti district, on the east it is bounded by Kullu district, on the South by Mandi, Hamirpur and Una district and on the west by Punjab state. The district lies between 31° 41' 0" and 32° 28' 05" in north latitudes and 75° 35' 34" and 77° 04' 46" in east longitudes. The district has a total area of 5,739 sq.kms. which covers 10.31 per cent area of the state. Kangra district ranks first in population and fourth in area among the districts of the state. The district consists of series of parallel mountain ranges divided by longitudinal valleys, the general direction of which, from north-west to south-east, has determined the shape of the district. These ridges and valleys increase gradually in elevation as they recede from plains and approach the snowy barrier which forms the northern boundary of district. Dhauladhar is the most important mountain range of the district which stretched out beautifully facing the fertile valleys of Palampur and Kangra. Dhauladhar range starts from the right bank of the river Beas and forms boundary of the district with Kullu district. There after the range passes through Banghal area above Kangra and Palampur valley covering Bara Banghal ridge, which is about 6,000 metres high from the mean sea level and there after runs parallel to another mountain range known as Hathi Dhar which forms boundary between Chamba and Kangra districts of the state. The Paprola range shuts out Bara Banghal from Kangra valley and this range after crossing Binoa at Paprola runs on to Mandi where it acquires the name of Sikandar Dhar and attains considerable elevation. Kangra valley and some areas of Dera Gopipur sub-district fall in the Beas valley and the valley stretching from Shahpur on the banks of river Ravi to Dhatwal on the border of Bilaspur falls in this zone.



2.5 Geology

The district lies in the Siwalik, Lesser Himalayan zone and its topography is well defined by a series of almost parallel hill ranges which rise in height towards north–east. The altitudes generally vary from 400 metres to over 6,000 metres and high reaches of the hill ranges are snow covered during most part of the year. Dhauladhar is the most important mountain range of the district. Another mountain range known as Hathi Dhar forms boundary between Chamba and Kangra districts. The area between Beas river which forms the southern boundary of the district and Chakki stream at the south-west is extensively cultivated. The rock facies commonly seen in the district are shale, clay and sand stone of Siwalik group. Green shales and fossil rich lime stones of Sabathu formation, gneissic and granatic rocks of Dhauladhar group, slate, phyllites, schists, quartzites, basic lava flows salt marl and dolomites belonging to Jutogh, Sundarnagar and Shali formations are found in the district. The Jutogh formation is one of the oldest groups of rocks and is seen in the north of Bandla and in a long stretch from the east of Bir to Dharamkot. The Sundarnagar formation is well exposed between Luni and Sansal khad and north of Tundi khad in Chakkinallah. The cement grade lime stone and salt grits of Dharamkot belong to Shali formation. The Saluni formation is exposed at Thamsar pass. The granitic rocks of Dhauladhar occur in a width of about 5 kms. across Dhauladhar ridge. The rocks of Sabathu formation are observed between Majir and Manuni. The valleys are filled with alluvial sand, slate and boulders. On the basis of physiography, climate, natural vegetation, soil and geology, this district is divided into 5 sub-micro regions which are described below.

Pir Panjal: This region is situated in extreme north–eastern part of the district spreading over Multhan sub-district consisting of Bara Banghal area. It is surrounded by Lahul & Spiti district from north, by Kullu district from east, by Dhauladhar from south and by Chamba district from west. This region covers most rugged part of the district, glaciers like Shah, Sililaluni, Tabni Lahuni, Jeshari, Kudi, Biaru, Phulan, Bhadol, Karu, Tantgariomd Raighar are main physical feature in this region. The elevation of this region varies between 2,429 metres and 6,023 metres above the mean sea level. Ravi river takes birth in this region and flows from east to west direction in the centre of the region. Laluni Nala and Tantgari Nala drain the waters of this region and join Ravi river on its right bank and left bank respectively. This region has severe climatic conditions. In the western part of this region, green patches of forests with mainly Pine trees are observed.

Dhauladhar: This region forms a horizontal tract running from north–west to south–east direction and includes north–western corner of the Kangra sub-district, north–eastern part of Dharmsala sub-district, northern part of Palampur sub-district and north–western, central and south–eastern parts of Baijnath sub-district. The region is bounded by Chamba district from north–west, by Pir Panjal from north–east, by Kullu district from east, by Mandi district from south–east, while Kangra valley encloses it from south and south–west direction. The elevation of this region varies between 1,819 metres and 5,194 metres above the mean sea level. Pine forests are observed in Banghal areas while in the remaining areas species like Oak and Deodar are found. Several rivers and streams viz Brahi, Khauli, Bhated, Baner, Neogol, Awa, Luni and Uhl which play major part in the drainage pattern of the district, originate in this region. Most part of this region remains under snow cover.

Kangra Valley: This region covers relatively plain areas of Kangra, Dharmsala, Palampur Baijnath subdistricts and Dhira and Thural sub-districts stretching in north-west to south-east direction. It is enclosed by Dhauladhar from north and north–east, by Mandi district from south–east, by Beas Basin from south, by Kangra Siwalik from south-west, while Chamba district touches it from west.

The region is relatively plain and fertile, but in the north–western part adjoining Dhauladhar region, it is rugged and mountainous. The elevation of this region ranges between 626 metres and 2,184 metres

above the mean sea level. Maximum tracts of this region fall between 600 to 900 metres of elevation. Important rivers/streams of this region are Gaj, Baner, Neogal and Binno. They originate from Dhauladhar and flow towards south direction and ultimately join Beas river.

Kangra Siwalik: This region extends over north-western and central parts of the district. It covers whole of Nurpur sub-district, Baroh sub-district and Harchakian sub-district, north-eastern Jawali subdistrict, south and south-western Kangra sub-district, western Dhira sub-district, northern and eastern extremes of Dera Gopipur sub-district, western margin of Khundian sub-district and very small tract of Palampur sub-district. It shares its boundaries with Chamba district in the north, with Kangra valley in the north–east, with Beas Basin in the south–east and south and with Punjab state in the west. This region is characterized by hills of small heights and thus Hathi Dhar and Kali Dhar ranges are the two main physical features of this region. These ranges has highest altitude of 1,599 metres and 1,097 metres, respectively, Chakki Khad in north–west direction forms the boundary of this region and separates it from Punjab state. Other rivers/streams which play an important part are Jabbar, Bhul, Chhaunchh, Dehar, Gaj and Baner and these all are the tributaries of Beas river. These are the source of irrigation facilities in this region.

Beas Basin: This region is formed of the western and southern parts of the district-covering whole of Indora, Jaswan, Jai Singhpur, Fatehpur and Rakkar sub-districts, south-western part of Jawali subdistrict, Dera Gopipur sub-district except its north–eastern extreme, southern extremes of Dhira, Palampur, Baijnath sub-districts and about 95 per cent of Khundian sub-district and Thural sub-district. It shares its boundaries with Kangra Siwalik and Kangra valley in the north, Mandi district in the east, Hamirpur and Una districts in the south and state of Punjab in the west. This region is relatively plain and has hills of lower elevation. Elevation in this region varies between 261 metres and 1,248 metres above the mean sea level. Solasinghi Dhar is the main physical feature of this region. Beas river is the life line of this region. The main tributaries of Beas river which join it on its right Bank are Binno, Mandh, Neogal, Tall, Nakehr, Baner, Gaj, Dehar, Bhul, Chhaunch khads while Sohan river, Ghamir, Gurhala, Daya, Chanaur, Ther, Nalsona and Sohari khads meet on its left bank in this region. The Soil of this region is fertile and due to the availability of irrigation facilities, intensive farming crops are grown twice in a year. Maize and potato are the main crops of this region.

2.6 Topography

Kangra district has a mountainous terrain with highly undulating landforms. The Altitude ranges from about 550 metres to 5,500 metres above mean sea level (amsl), The rise being gradual to about 1,500 metres amsl whence after it becomes abrupt. The district has a maximum length of about150 km from Baijnath block to Indora block in east-west direction. It extends to a distance of about 100 km from Rait to Pragpur block in the north-south direction. The entire territory is mountainous with the exception of the erstwhile Nurpur tehsil (covering the blocks of Nurpur, Indora, Fatehpur and parts of Nagrota Surian), which accounts for roughly 15 per cent of the Area is total area of the district. Deep valleys lying between ranges of varying elevations characterize the mountainous portion, which comprises the bulk of the territory.

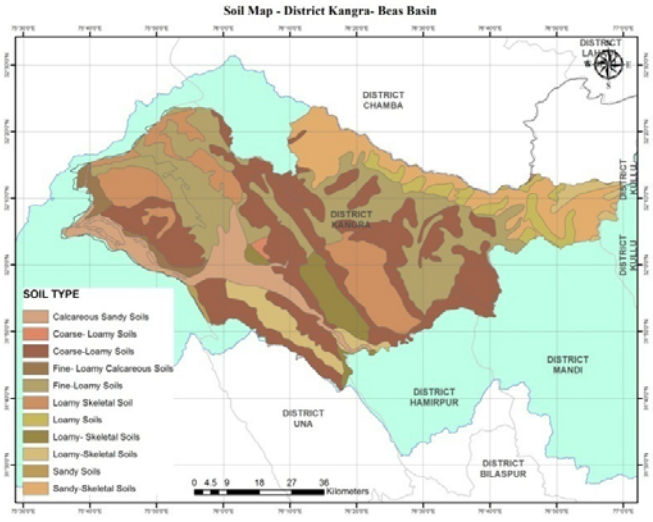
Altitudinally, the district has three distinct zones. These are:

1. Low hills and valley areas up to an elevation of about 900 metres a.m.s.l. This portion accounts for about 49.0 per cent of the total area in the district.
2. Mid hills extending from 900 metres to 1,500 metres a.m.s.l. This is nearly 16.0 per cent of the district area.

3. High hills rising from about 1,500 metres to 5500 metres a.m.s.l account for the remaining 35.0 per cent of the entire area.

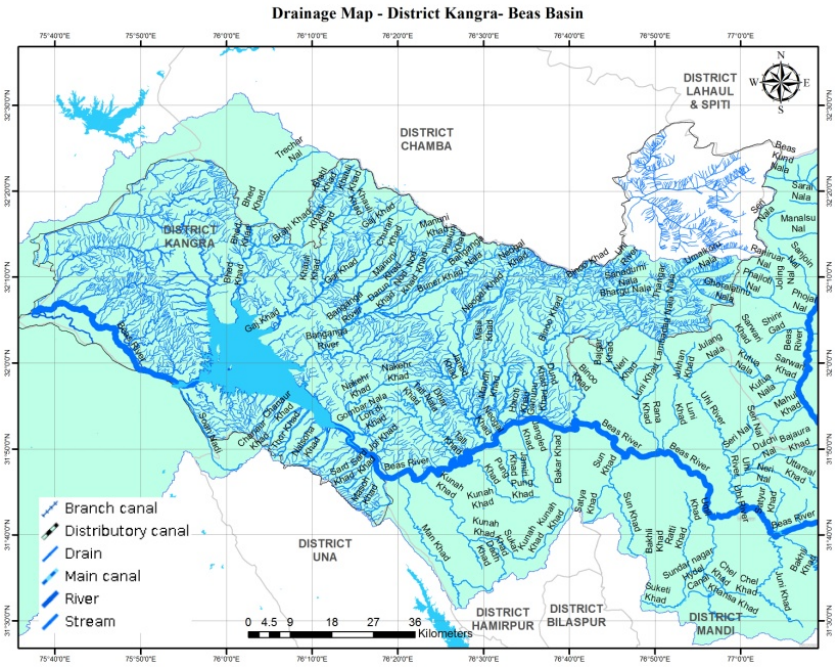
2.7 Soils

The geological structure of this district pertains to Alluvium, Siwalik, Murree Series, Jutogh groups, Granites (unclassified) and Panjal Traps formation. The soil in the district varies from sandy loam to clay. According to N.B.S.S. & L.U.P. (I.C.A.R.), Nagpur, soils of the district are mainly classified as Ochrepts (70) which are shallow black, brown and alluvial soils of northern region. Only in north–eastern extreme of the district Udalfs (20) soils are observed which high base status soils of humid regions are. The vegetation in the district varies from dry scrub forests at lower elevation to alpine pasture at higher altitudes. In between the two extremities occur distinctive vegetation zones of Chir, Ban, Oak, mixed coniferous (Kail, Spruce, Fir) and Kharsu Oak forests. Scattered patches of forests are seen on the slopes of hills lying mostly in the central part of the district.



2.8 Drainage (River System)

Beas is the principal river which receives almost the entire drainage of the district. River rises from the Pir Panjal range near Rohtang pass at a height of over 4,000 metres from the mean sea level. The river after flowing through Kullu and Mandi districts enters Kangra district at Sanghol in Jai Singhpur sub-district. From this point the river takes a south–west turn and enters the valley of Nadaun in Hamirpur district. Here the Jaswan chain obstructs its further passage to south and the river flows in the north–west direction almost parallel to the strike of the hills. At Mirthal ghat beyond Hajipur, the hills subside and the liberated water flows in an uninterrupted direction towards the plains. This river is at its lowest during the winter months of December, January and February and at the highest during the rainy months of July and August. The principal tributaries of the river during its course through Kangra descend from the lofty range which divides the district from Chamba district. Binva stream rises in the hills above Bainjath, a well celebrated historical hill shrine, and after receving the waters of Awa stream and some minor affluents join the river above



Sanghol. Neugal stream discharges itself into the river opposite Tira Sujanpur. Ban Ganga, Gaj and its tributary Dehr and Chakki nalah which forms the boundary of the district with Gurdaspur of Punjab also feed the river.

2.9 Climate

Climate plays a vital role in the field of life style and economic growth of the state, especially the performance of agriculture, horticulture and tourism sector is closely related to the performance of rain and snowfall during the season. The climate in the district unfolds four broad seasons. The winter generally spreads over from December to February. The period from March to June is summer. Hot and rainy season generally extends from July to September. October and November exhibit autumn. While during the winter months, the places at high altitudes remain covered under snow. The temperature during the winter months even in the lower areas is too cold because of the lashing cold breeze of the mountain ranges of Dhauladhar and Hathi Dhar. The places lying at higher altitudes are too wet in the rainy season. Dharmsala, the headquarters of the district receives plentiful rains during the summer months. In the valleys and southern parts of the district, the days are extremely hot. During the monsoon period the land becomes fresh and green and the small water channels in the hills begin to swell. The climatic conditions prevailing in Kangra district are most useful for growing food crops, forestry, tea plantation, floriculture and other natural herbals.

2.10 Agriculture & Horticulture

Agriculture is the main Occupation of the people of Himachal Pradesh. It has an important place in the economy of the state. It provides direct employment to 70 per cent of the total workers of the state. It also is a premier source of state income (GSDP). About 17 per cent of GSDP comes from agriculture and its allied sectors. Similarly agriculture is also the main occupation of the people of Kangra district. The agro-climatic conditions prevailing in the district are favourable for growing of food crops such as wheat, paddy, maize, oil seeds, potato, sugarcane etc. Tea & potato are the two cash crops. There are two types of crops, 'rabi' and 'kharif'. Rabi crop is sown before winter and harvested in the months of April & May. Popular Rabi crops are wheat, barley, gram and oil seeds. Kharif crop is sown before the monsoon and is ready for harvesting in September-October. Main kharif crops are maize, paddy, oil seeds, pulses, spices & potatos.

Horticulture has become a fast growing occupation in the district. Agro climatic condition prevailing in the district offers a great scope for the production of temperate and sub – tropical fruits. Horticulture has a great potential in improving the economic condition of the people of the district. Climate of the district offer a great scope for growing citrus fruits, mangoes, litchi and guava on the larger scale. Due to better market prices production of pomegranate, papaya and even apple, plum, peach, apricot and pear is fetching the attention of the farmers.

Tea plantation in Kangra district is done at elevation ranging from 800 metres to 1,600 metres above the mean sea level. The cultivation is done on well-drained medium loam soil on the slopes of hilly

land with annual rain fall varying between 175 cms. to 375 cms. Green and black tea is produced in the district. With the setting up of processing factory at village Bir in Palampur sub-district, the quality of production has improved considerably. The pioneers of tea plantation in Kangra district were British ex-military officers who had settled in Kangra district around the year 1850. Till the earthquake of Kangra in the year 1905, the tea produced in the district was exported to Britain and Russia. Earthquake took heavy toll of the plantations and tea industry was affected badly. After independence the tea plantation work in the district picked up considerably. Himachal Pradesh Agriculture University at Palampur is engaged in research work for the improvement of tea production in the state. Emphasis is also being made on the mechanical farming. The equipments, fertilizers and pesticides are being supplied on subsidized rates.

2.11 Forest

The forest plays a vital role in shaping the climatic conditions of an area. Besides this it also influence the socio-economic life of the people. The forest provides valuable timber, various kinds of medicinal herbs, raw material to industries. Forests not only provide employment but also play a vital role in conserving the soil and control the climate calendar of the region. The forests of Kangra district have a great variety of vegetation due to variations in altitude, geological formations and climatic factors. The forests are spread over the most part on the northern slopes of the hill ranges and contain much useful timber. The vegetation varies from the tropical bamboo which covers the lower hills to alpine vegetation, oak, pine and rhododendron of higher ranges. In between two extremities occur distinctive vegetation zones of chil, ban-oak, mixed coniferous (kail, spruce, fir) and Kharsu oak forests. The forests of Kangra can be classified into seven main groups. Kangra forests have a large number of aromatic and medicinal plants which can be utilized for the pharmaceutical and ayurvedic medicines like dhoop, karu/kour, brahmi, kuth/khuth, bankakri etc. Social Farm Forestry Programme has done extensive plantations on public waste lands, schools compounds and private farm land. People are encouraged to plant more trees and protect the existing growth in order to enable them to meet the bonafide requirement of fodder, fuel and small timber.

2.12 Fisheries

Himachal Pradesh is one of the states of country which has been gifted by nature with beautiful rivers emanating from glaciers which traverse through hilly terrains. Kangra district is traversed by 500–600 kms. of rivers and streams which form major riverine fisheries resources for the rural masses and fishermen. These fishermen get licences at very nominal rate and in return catch fish throughout the year barring two months from 15th June to 15th August which is recognized as the breeding season of the fish. Kangra district has more than 400 hectares in the shape of rural ponds. The fish breeding farm is situated in Kangra town to meet the demand of the fish seed. There is about 40-50 kms. river stretches in river Boher,

Neryal and Binwa where the propagation of trout fish seed is done. A National Fish Seed Farm has been established in village Meelavan in Indora sub-district of the district. There is a vast man-made lake in the district known as Pong Reservoir which has been formed by constructing dam on river Beas in the year 1974. It has a total area of 24,629 hectares. The Pong reservoir is predominantly a catch fish reservoir. The commercially important fish species in Pong Dam reservoir have become a tool for the upliftment of local population. There are 3,458 licensed fishermen in the district during the year of 2008-09. Total production of prawn fish has been recorded to 2540.11 M.Ts valued to 1,330 lacks of rupees of which 205.58 M.Ts was exported outside the state. The success of the reservoir is mainly attributed to strict observance of fishing rules and initiation of number of fishermen welfare schemes.

2.13 Livestock and animal husbandry

Rearing of livestock is an integral component of rural economy. It is the main wealth next to agriculture of a large chunk of rural population in the state. Livestock thus is an important integral part to the sustainability of economy not only of the district but of Himachal Pradesh also. Dairy production is an integral part of the animal husbandry and forms a part of the earning of small farm holders in the district. The recent trend toward the development of a market oriented economy emphasized the importance of milk production, especially in areas falling in the vicinity of urban consumption centres. This has motivated farmers to replace local non-descript breeds of cows with the cross-breeds cows. Up gradation of indigenous cattle is being carried out by cross breeding with Jersay and Holsten. In buffalo up gradation with Murrah bull is being popularized. Artificial insemination with the latest technology of Deep Frozen Semen is being practiced.

2.14 Industry

Though Himachal Pradesh is a hilly state even then it has made significant achievements in the field of industrialization during the past few years. With the ushering of liberalized economy and further various incentives the flow of investment in the state has increased manifold resulting in good response for setting up new industrial ventures in the state, but the area for development for the industrial activities is confined to few districts of the state only. Kangra district, due to its natural resources, cool and calm dust free climate has favourable conditions for setting up agro and electronics based industry. The changes of setting up large scale industry are meager but it has a scope for the small and medium size industries.

Three industrial estates have been set up to provide infrastructure facilities to the entrepreneurs at Kangra, Jawali and Dera Gopipur in the district. Besides these, seven industrial areas namely Nagrota Bagwan, Nagri, Dhaliyara, Sansarpur Terrace, Baib Attariyan, Nagrala and Raja-ka-Bagh have been set up to attract the entrepreneurs from the different parts of the country. Five Industrial Training Institutes at Shahpur, Nurpur, Neharan Pukhar, Dhameta and Saliyana have been established to provide training in different trades. In addition to these, three more institutes for women are also functioning at Dharmsala, Palampur and Jawali.

One Government Polytechnic has been set up at Kangra. Prime Minister 'Rojgar Yogna' for providing assistance to educated unemployed youths for selfemployment has been launched all over the state.

There is a potentiality for setting up of herbal, mineral, horticultural and agricultural based industries in the district. The state government is giving special emphasis for electronic units. Tea is grown in Kangra district especially in Dharmsala, Palampur and Baijnath at an altitude between 1,000 metres to 1,500 metres above mean sea level. In addition to it, there is a vast scope of tourism in the district.

A good number of people are engaged in 'dhoop' making, lakh industry, katha making, slate industry, wool spinning and weaving, bamboo work and pottery. The industrial growth in the district has been hampered by certain constraints as transportation of raw material and finished goods which entails much cost resulting high cost of finished goods. Apart from this, handloom and handicrafts are also important household and cottage industry of the district. Handloom work, such as Floral Shawls, Carpet Weaving, Gudmas and Namdas, Bed Sheets, Woollen Sweaters and Mufflers are produced in various parts of the district, employing good number of local people. Wooden Work, Bamboo Work and Pottery is also providing gainful employment to the people. Kangra district falls in industrially backward areas and entrepreneurs are entitled for several concessions such as exemption of sales tax, income tax rebate, subsidised land/sheds in industrial area and transport subsidy under the new industrial policy of the State Government. The industrial units have been categorised as priority sector, village industry and medium/large scale sector excluding units in priority sector for the purpose of concession, incentives and other facilities.

2.15 Tourism

Tourism in Himachal Pradesh has been recognized as one of the most important sectors of the economy as it is being realized as a major engine of growth for future. Himachal Pradesh as a whole is endowed with all the basic resources necessary for thriving tourism activity like geographical and cultural diversity, clean, peaceful and beautiful streams, sacred shrines, historic monuments, lush green forests and above all friendly and hospitable people. Tourism industry in Himachal Pradesh has been given very high priority and has developed appropriate infrastructure for its development which include provision of public utility services, road, communication network, airports, transport facilities, water supply and civic amenities etc. The district has also created its impact in tourism sector and attracted number of tourists to its fold. Kangra district as whole is a land of sublime joys with delightful contrasts, floral meadows, monasteries, churches, tea gardens, rugged mountain ranges and gushing rivulets besides prominent religious shrines. With the arrival of His Holiness the Dalai Lama in 1966 which infused the strain of Tibetan culture into the Kangra valley, many prominent monasteries have come up and the whole valley has become a land of attraction not only to domestic but foreign tourists also.

3.1 Profile: Development Block – Baijnath

Baijnath is a Block placed in Kangra district in Himachal Pradesh. Placed in rural part of Himachal Pradesh, it is one among the 15 blocks of Kangra district. The block has 219 census villages & town and there are total 20933 houses in this Block. As per Census 2011, Baijnath's population is 92047. Out of this, 46219 are males while the females count 45828 here. This block has 9903 children in the age group of 0-6 years. Among them 5188 are boys and 4715 are girls. Literacy ratio in Baijnath block is 72%. 66873 out of total 92047 population is literate. Among males the literacy rate is 79% as 36535 males out of total 46219 are literate however female literacy rate is 66% as 30338 out of total 45828 females are literate in this Block. Here 25174 out of total 92047 people are illiterate. Male illiteracy ratio here is 20% as 9684 males out of total 46219 are illiterate. Among the females the illiteracy ratio is 33% and 15490 out of total 45828 females are illiterate in this block.

Climate Change: District Kangra

4 Climate Change: District Kangra

4.1 Climate Change Vulnerability Assessments

The State of Himachal Pradesh through Department of Environment, Science & Technology has prepared a comprehensive "State Strategy & Action Plan on Climate Change (SAPCC)". Under this action plan block level climate change vulnerability assessment has been undertaken. The philosophy and concept of Exposure, Sensitivity and Adaptive Capacity has been used to analyse climate change vulnerability assessment. The findings of SAPCC are as under:

Climate Change Vulnerability Index of Kangra District (Block Level)

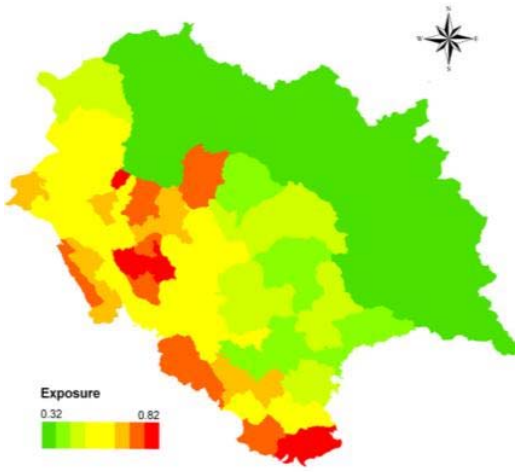
Sr. No.	Tehsil/ Block	Components			Vulnerability Index
		Exposure	Sensitivity	Adaptive Capacity	
1.	Dharamsala	0.81	0.29	0.29	0.88
2.	Kangra	0.69	0.28	0.28	0.43
3.	Bhawarna	0.73	0.28	0.28	0.62
4.	Panchrukhi	0.70	0.28	0.28	0.67
5.	Nurpur	0.69	0.20	0.20	0.69
6.	Nagrota Bagwan	0.68	0.30	0.30	0.63
7.	Rait	0.69	0.25	0.25	0.48
8.	Fatehpur	0.68	0.19	0.19	0.70
9.	Indora	0.70	0.21	0.21	0.70
10.	Pragpur	0.69	0.20	0.20	0.67
11.	Lambagaon	0.69	0.19	0.19	0.68
12.	Behdu Mahadev	0.68	0.27	0.27	0.76
13.	Dehra	0.68	0.19	0.19	0.67
14.	Nagrota Surian	0.69	0.18	0.18	0.65
15.	Baijnath	0.71	0.19	0.19	0.64

Higher the value, high is the vulnerability
Source: SAPCC, Himachal Pradesh

Exposure

The exposure has been determined in terms of climatic variables such as annual mean temperatures, annual mean rainfall pattern and no of extreme events, rainy days etc. It has been observed that the Himachal Pradesh is exposed to a range of climate conditions and extreme events. In particular, some of the key features of the region's climate are the influences of monsoons, the El Niño-Southern Oscillation, and cyclones on the rainfall in the State. Most part of the State is adapted to, and thus reliant upon, the annual monsoon occurrence, which makes it vulnerable if the monsoon fails and rainfall is significantly limited/less. Meanwhile, variability associated with the El Niño-Southern Oscillation, and particularly El Niño events, contributes to cyclic droughts. Besides, much of area gets affected by tropical disturbances and their associated high winds, snow, hail storms, and extreme rainfall. These climate challenges are the permanent features of the Himachal Himalayan region, but that may be significantly altered by anthropogenic climate change in the decades ahead as well.

Temperature is a critical parameter of climate which strongly influences people, biodiversity and ecosystems, important driver of natural and man managed systems. As per the analysis, in the last few decades, the average temperatures have been found to vary from normal ranges for Himachal Pradesh and yearly variations in average temperature are indicative of this trend. Variability, leading to higher temperatures shows higher exposure level of the different Blocks in different districts.

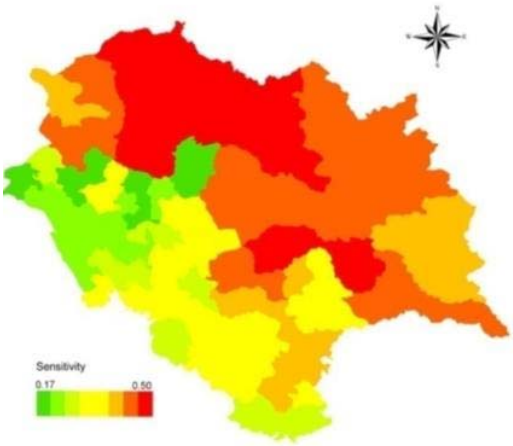


Map 4.1 Exposure Map of HP

Precipitation is an important component of the water balance and ecosystem. Normally, rainfall patterns are dependent on a range of factors such as topography, local climate and wind patterns. In Himachal Pradesh, as per analysis of the long term

database it is observed that during the past century, some areas have experienced an average rainfall, some areas have experienced increase in the rainfall and few areas have faced reduction with variation in frequency and intensity. A change in the timing of run-off impacts the water availability, which will resultantly impact progress in developing areas, crops, agriculture, livelihoods and eventually the entire economy. Average rainfall and change in pattern in different region shows higher level of exposure to climate change.

The analysis of results reveals that the low lying areas of Himachal Pradesh are highly exposed to climate change. The areas falling in Hamirpur, Sirmaur, Solan and Una districts are highly exposed whereas, Kangra, Chamba and Hamirpur districts are also exposed but comparatively less than the above districts. Likewise areas falling in and Shimla and Kullu districts are also moderately exposed to climate change.

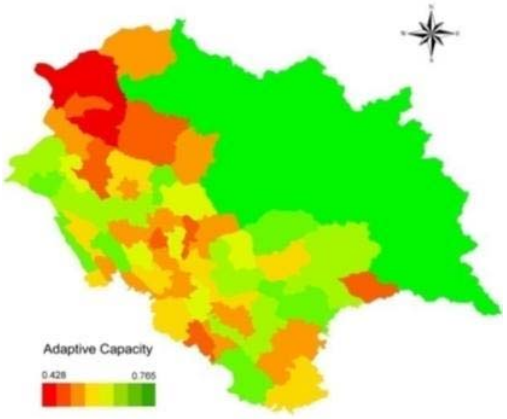


Map 4.2 Sensitivity Map of HP

Sensitivity

The sensitivity component includes four indictors such as Agriculture-livelihoods, Water resources, Forests and Health. It has been observed that, Besides being exposed to a variety of climate hazards, the vulnerability of Himachal Pradesh in the Himalayan region also gets affected by the sensitivity of different neighbouring States and sectors to these hazards when they occur. For example, with much of their subsistence and economic growth dependent upon agriculture, the potential for widespread adverse impacts is enhanced in these areas. Likewise, the existing water resources are limited in many areas under development, as is subsequently, access to safe drinking water, sanitation, and irrigation. In case of drought or flood, the ability to safely and efficiently manage water storage, diversion, and delivery would be easily compromised. Settlements and infrastructure in Himachal Pradesh tend to be more susceptible to the effects of climate extremes and are more likely to be damaged. The analysis shows that low-lying river bed areas, including hydro power projects, are more sensitive to the effects of water level rise and flood like situations and thus have potentially more to lose from climate change than the other regions. Statistics indicate that extreme events in the region are associated with significant financial losses as well as the loss of lives, and as explained above such disasters in the region has increased in recent decades/years.

There are few regions where forest cover has decreased and less forest cover would thus be more sensitive and vulnerable to climate change if the same trend continues. Land use change has a direct linkage with climate change. The deforestation, habitat fragmentation, urban expansion and other developmental modifications have significantly changed the land use patterns. Extensive land use changes have an impact on livelihoods of people and ecosystems. The areas where agriculture workers are more would be more sensitive to climate change. Clearing of vegetation leads to degradation of area and enhances the sensitivity towards climate variability; resultantly the biodiversity gets impacted adversely. Further, an increase in gross sown area will raise the sensitivity levels of the different areas of various districts. Higher family size or the birth rate would increase the sensitivity since there will be competition for scarce resources. The analysis depicts different levels of sensitivity with different trends of indicators.



Map 4.3 Adaptive Capacity Map of HP

Adaptive Capacity

The socio economic conditions give measures on adaptive capacity which contain economic capacity, poverty rate and, roads connectivity, literacy rate, environment management infrastructure with population density. Adaptive capacity is the ability or potential of a system to respond successfully to climate variability and change, and includes adjustments in both behaviour and in resources and technologies. The presence of adaptive capacity has been shown to be a necessary condition for the design and implementation of effective adaptation strategies so as to reduce the likelihood and the magnitude of harmful outcomes resulting from climate change (Brooks and Adger, 2005). Adaptive capacity also enables sectors and institutions to take advantage of opportunities or benefits from climate change, such as a longer growing season.

From analysis of database it is evident that the areas which have high percentage of poverty are more exposed shows low economic capacity and, therefore, has less adaptive capacity and more vulnerability. Higher literacy rate, road network shows higher adaptive capacity. More is the population, lesser the adaptive capacity in the region.

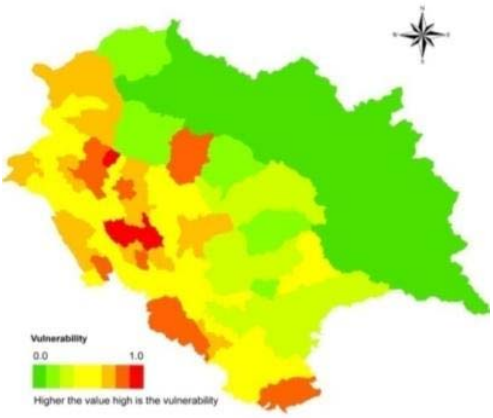
Vulnerability

The analysis of the index of vulnerability at the Block level of all districts of State has been calculated and analysed using index based approach which primarily is an outcome-based vulnerability measurement.

From the analysis it is observed that the adaptive capacity of Lahaul & Spiti, Kinnaur, some areas of Kangra, Shimla and Hamirpur districts is better. The adaptive capacity of District Chamba, Hamirpur, Una, Solan and Sirmaur is poor to cope with the impacts of climate change.

When combined together all the three components i.e. Exposure, Sensitivity and Adaptive Capacity, the results indicates that Hamirpur, Kangra, Una, Solan, Bilaspur, Sirmaur districts are highly vulnerable to climate change whereas, the districts Hamirpur, Shimla, Kullu, Chamba are moderately vulnerable.

The Vulnerability Index tries to capture a more comprehensive scale of vulnerability to give composite Vulnerability Index. It has been calculated by including many indicators that serve as proxies to look at different aspects of vulnerability. In other words, it has been assumed that vulnerability can arise out of a variety of factors. In particular, different sources of vulnerability; broadly climatic factors, demographic factors, agricultural factors and occupational factors has been taken into consideration.



Map 4.4 Vulnerability Map of HP

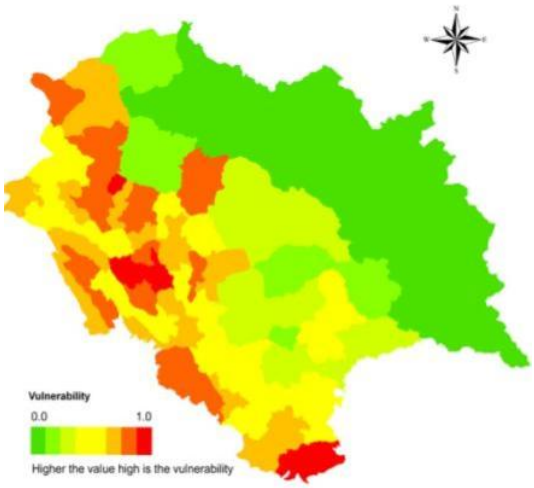
Projection of Scenarios 2020 and 2030

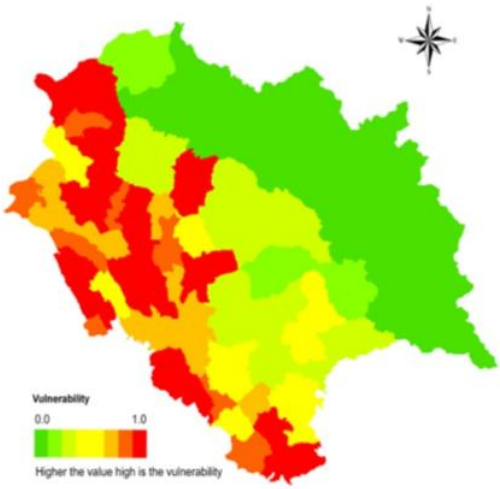
It has been observed that the Himachal Pradesh receives most of its rain during the monsoon season, which starts in the late June. The mean seasonal precipitation simulated by PRECIS shows variations for Indian sub continent. Under A1B scenario, mean annual rainfall is projected to increase marginally for the State by about (5% to 13%) i.e. 70-200 mm by 2030. Increase in monsoon season, and marginal increase in other seasons with increase in rainy days.

Besides, on the basis of available data base w.r.t. temperature (max & min) and precipitation form IMD Pune and after working out the decadal variation on average basis, decadal scenarios for climate variations i.e. variations in rain fall and temperature for 2020 and 2030 have been projected (No specific PRECIS or HADCM simulations have been worked out for Himachal Pradesh separately) and have been further analyzed for deriving Vulnerability Index while assuming that the sensitivity and adaptive capacity would continue to show the same pattern* (The adaptive capacity & sensitivity could not be analyzed for decadal scenarios in view of lack of data base for specific variables and also that the adaptive capacity or sensitivity will not show any change in its pattern in case projected on simple average methods).

* (Even if the increase in biodiversity or growth in infrastructural facilities is observed)

Therefore, the exposure based projections on decadal variations have been plotted on spatial maps to see the likely/ possible changes in 2020 & 2030.





Map 4.5 Vulnerability 2020 Scenario **Map 4.6 Vulnerability 2030 Scenario**

It has been observed that the Climate Change vulnerability in 2020 scenario the areas of districts Sirmaur, Solan, Bilaspur, Una, Kangra, Hamirpur, Kullu, Chamba will be at risk, that means the regions falling under sub mountain zone will be at risk while other will have lower risk.

Similarly, the Climate Change Vulnerability Projections for 2030 indicates that the vulnerability of low lying areas i.e. sub mountain low hills sub tropical region, mid hills sub humid will be at higher risk and high hill temperate wet will be under moderate risk while dry region will be continue to have lower risk even in 2030.

5

Climate Change Hazard Scenarios: District Kangra

5 Climate Change Hazard Scenarios: District Kangra

5.1 Climate Change Induced Natural Hazards

The climate of the district varies from sub-tropical in low hills and valleys to sub- humid in the mid hills and getting temperate in high hills. The district receives an average annual rainfall of about 205 cm that goes up from about 100 cm in southern parts to about 250 cm in north eastern areas. Most of the rainfall, about 80 per cent, is received during June to September months. Average annual rainfall in the district during the last one and a half decade is given in Table 3.1. In contrast, the average annual rainfall in the state during the same period was 1254.6 mm. Snowfall is also received in northern parts around Dharamshala, Palampur and Baijnath areas. Average maximum temperature ranges from about 35.0 degree Celsius in southern parts to around 25.0 degree Celsius in northern areas.

District Kangra is prone to various climate induced hazards both natural and manmade. In the District the geological hazard, mainly earthquakes, landslides and soil erosion are most critical, the flash flood, cloud burst, drought and forest fire is also hydro metrological hazard.

5.1.1 Floods & Flash Floods

River Beas and its tributaries constitute the main drainage system in Kangra district except for the extreme north-eastern part in Bara Bhangal area where it forms a part of the river, Ravi. Generally, the drainage system is marked by structural and slope conditions. The Beas River enters the district near village Harsi from the east and flows towards the west before it leaves Kangra (and Himachal Pradesh) at Mirthal in Punjab. The major southernly flowing tributaries are Neugal, Awa, Binnu, Baner, Naker, Gaj and Dehar khads. All these khads being snowfed are perennial.

Northernly flowing streams are ephemeral. The various khads/streams and their catchment areas are given in below Table. Banganga, Dehar, Neogal and Awa originate from high Dhauladhar ranges in the north. Banganga, Gaj, Dehar, Bohl and Nand Khads join the Pong reservoir directly, while Neugal and Awa join the Beas River in the upstream of Nadaun. These khads have deep valleys in the hilly area. The valleys are wide in the Kangra valley region where the slope/gradient of the rivers is gentle. The course of these rivers is structurally controlled. The gradient and flow are being utilized both for irrigation and power generations.

A number of micro hydel projects are under construction on these khads. The water of these rivers is also used for irrigation by diverting its flows through kuhls (gravity channels). The northerly flowing tributaries 'choes' are ephemeral and have flash floods during the monsoons. The width of these stream channels varies from less than a kilometre to more than 2 km. The channel areas are generally devoid of vegetation. The important khads are Pragpur, Nalsuha, Chanour and Dada Siba.

Sr. No.	Name of River/ *Khad*	Catchment Area (sq.km)	Remarks
1	Nand khad	**39**	Joins directly
2	Buhl khad	104	Pong Dam
3	Dehar khad	477	Pong Dam

4	Gaj khad	616	Pong Dam
5	Bunner khad	782	Pong Dam
6	Pola khad	47	Pong Dam
7	Naker khad	184	Joins Beas river
8	Neogal khad	--	Joins Beas river
9	Binno	--	Joins Beas river

The occurrence of water related natural disasters especially floods and flash floods are common in most of the district Kangra. Flood mainly occurs due to over-topping of rivers, heavy rainfall, melting of snow and bank erosion because of steep slopes of river. On the other hand, another type of flood which is most common in the district is flash-flood. The flash floods are extreme events that are sudden, severe and short lived. It is a sudden and often destructive surge of water down a narrow channel or sloping ground, usually caused by heavy rainfall[1]. Flash-floods are mostly the result of cloudbursts or blockage of river channel due to landslides. The flood problem in the state is mainly during the months of June to August when the south west monsoon is in progress and snow is melting in the higher reaches.

Floods are one of the worst disasters of the district that not only causes huge economic loss in the form of damage to houses, public utilities, and property but also many human lives and cattle heads are also lost. Almost all rivulets of the district carry heavy discharge during the monsoon when their catchments receive intense and heavy rainfall. Pong dam also prone to flood during rainy season. Major Tehsils wrap by Pong dam are fathehpur, Jawali, Indora and jaswan Kotla.

Year	Persons Killed	Livestock killed	Houses Loss	Cow shed Loss
2007	11	105	297	**233**
2008	11	504	1187	**1715**
2009	05	42	160	**59**
2010	03	45	690	**263**
2011	**09**	**88**	**1040**	**985**

The district being in hilly and plain terrain, the flood and landslide problem are common in nature due to Pong dam on the Beas River and local khad are result of flash flood during the rainy season. These result huge loss of lives and properties. The 7 persons were dead in the flood on 24th September 1988.

People live their lives near Beas River due to availability of fertile land there but in rainy season they are shifted to safe place by administration. It put terrible impact on lively hood, live stock, infrastructure and property.

5.1.2 Cloud Bursts

Most of the part of district Kangra is hilly and it is prone to Cloud burst and build floods in local water channel during rainy season. Main affected tehsils are Palumpur, Baijnath, upper region of Shahpur, Multhan and upper part of Dharamshala etc.

Year	Case occurred	Persons Killed	Persons injured	Livestock killed	Infrastructure loss
2009	01	2 (women)	01	17 (Goats)	09 (8 Houses & 01 Cow shed)

5.1.3 Forest Fire and Urban, Rural Fire

Kangra district has four forest divisions, namely, Dharamshala, Dehra, Nurpur and Palampur. In addition, two forest blocks are under the control of Una forest division. Mostly Forest fire occurs in summer period from April to June. The forest fires destroys the existing vegetation, killing plants, numerous insects, small animals and reptiles essential for balancing the eco-system.

The local myth in the area is that lush green grass grows after fire. On the contrary, the ash content increases the acidic nature of the soil, thereby leading to soil erosion. Continuous fires in fact make the grass coarser. Relatively, forest fires destroy the natural binding of rocks, leading later to landslides in the area. The major reason for the forest fire is hot summers and large number of pine trees plantation.

5.1.4 Drought

The crops of maize, rice (Dhan), wheat, vegetables and orchards have been affected due to uncertain rain and climatic changes in the area. The drought has also damaged cash crops like tomato, carrot, Potato, cauliflower, and cabbage. These crops depend on water sources, which are fed by the monsoons. Moreover Low belt region and rain shadow area of changar region of district is prone to drought whenever there is lean monsoon/ winter rain season because agriculture depends for irrigation on the rain. Major damage in district was occurred in April 1994. Main area was Jawalamukhi and Dehra.

5.1.5 Landslides

The hills and mountains of District Kangra are liable to suffer land slides during monsoons and also in high intensity earthquake. The vulnerability of the geologically young and not so stable steep slopes in various Dholadhar, Chamba Dhar ranges, has been increasing at a rapid rate in the recent decades due to inappropriate human activity like deforestation, road cutting, terracing and changes in agricultural crops requiring more intense watering etc.

Climate Change Vulnerability Assessment - Conceptual framework

6. Climate Change Vulnerability Assessment - Conceptual framework

Evolution of Vulnerability Assessment Framework (Pre-IPCC 2007)

The pre-IPCC 2007 period witnessed a transition from hazard-based impact assessments to adaptation-driven need for vulnerability assessments (Fussel and Klein 2006). In the discourse evolving in climate change context, vulnerability was understood to indicate the adverse impact of an exposure from a climatic hazard that depended on the rate, magnitude and duration of such exposure, and the sensitivity and adaptive capacity of a system. Vulnerability was thus understood to represent the potential for harmful outcome of the interaction of an external stress (exposure) with the sensitivity and adaptive capacity of a system.

Accordingly, the studies attempting vulnerability assessments adopted frameworks that considered vulnerability as a function of exposure, sensitivity and adaptive capacity. All the three components were assessed and combined to arrive at the vulnerability. Importantly, the vulnerability assessment discourse prior to 2007 identified sensitivity and adaptive capacity as internal properties of a system, and exposure as external to system. This approach to assessment, considering vulnerability in terms of an adverse outcome, is referred to as 'end point approach'.

IPCC 2007

The pre-2007 understanding and articulation of vulnerability and its synthesis as a function of exposure, sensitivity and adaptive capacity were adopted in the IPCC 2007 Working Group II Assessment Report. IPCC (2007) defined vulnerability to climate change as "the degree, to which a system is susceptible to, and unable to cope with, adverse effects of climate change, including climate variability and extremes. Vulnerability is a function of the character, magnitude, and rate of climate change and variation to which a system is exposed, its sensitivity, and its adaptive capacity".

This definition of vulnerability has remained the same between the 2001 and 2007 IPCC reports except that the word 'or' is substituted by 'and' in the first part of the definition in 2007 report; this is in order to clarify that sensitivity and lack of adaptability should not be taken as alternative definitions of vulnerability but as its co- factors (Fussel and Klein 2006). The vulnerability assessment frameworks continued to consider all the three components – E, S and AC; however, the number of studies and sectors assessed multiplied and novel methodologies, tools and techniques were developed and used.

IPCC 2014

The IPCC special report on 'Managing risks from extreme events and disasters to advance climate change adaptation' published in 2012 suggested the risk management framework that depicted risk arising from the interaction of hazard, exposure and vulnerability. This framework separated exposure from vulnerability. Vulnerability in this construct is considered a system property composed of its sensitivity and adaptive capacity.

The IPCC 2014 report has adopted this construct of vulnerability and defined it as propensity of a system to be adversely affected, which is to be considered independent of the element of exposure. According to IPCC 2014 report therefore, vulnerability is a characteristic property of a system that shows its current internal state. The risk management framework adopted by the IPCC in the Fifth Assessment Report (IPCC 2014) depicts that hazard; exposure and vulnerability interact and result in risk within the overall climatic and non-climatic physical and socio-political environment. Accordingly, in this report, vulnerability assessment framework considers only sensitivity and adaptive capacity as the two cofactors determining vulnerability.

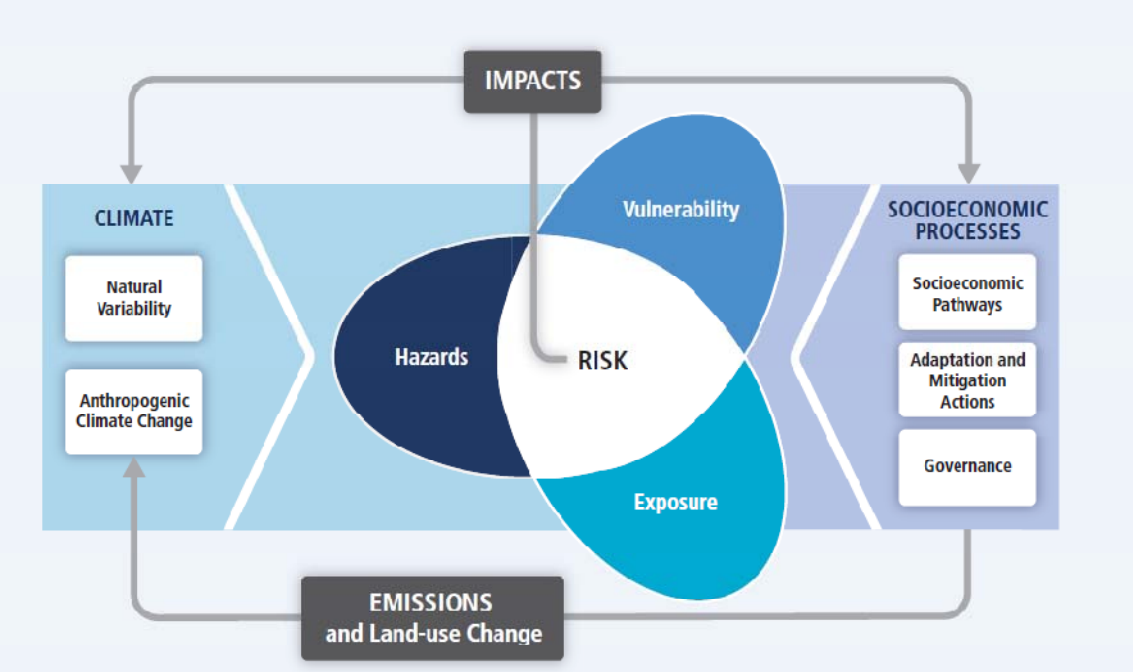

Figure 6.1 The risk management and assessment framework.
Risk arises from interaction of vulnerability, exposure and hazard (Source; IPCC, 2014)

Comparative assessment of IPCC-2007 and IPCC-2014 frameworks

The change of approach from IPCC-2007 that considered vulnerability as a resultant of exposure, sensitivity and adaptive capacity, to a system attribute represented by the internal properties of the system (sensitivity and adaptive capacity) in IPCC-2014 has brought about a fundamental change in the approach to assess vulnerability.

IPCC-2007 Framework	IPCC-2014 Framework
Vulnerability Framework: components - *Exposure (E)* - *Adaptive capacity (AC)* - *Sensitivity (S)*	*Vulnerability is presented in the overall Risk management framework Vulnerability presented as one of the three components (other two are E and H) that give rise to risk.* *E component separated from vulnerability*
Vulnerability, the residual impact after the potential impact caused by E due to the sensitivity (S) of the system is moderated by its AC	*Vulnerability (propensity of a system to be harmed), a system property shaped by S and AC of a system*
Focus of the assessment is on the exposure and the adverse effect it results in for a system	*Focus of the assessment is on the (internal state of) system*
Vulnerability assessed considering E to a hazard (H)	*Vulnerability is assessed independent of E*
E represented disturbance dosage from a climatic hazard (H); so occurrence of H subsumed in E	*E represents presence of a vulnerable system at a location where hazard occurs. H is a co-factor with E and vulnerability in giving rise to risk.*

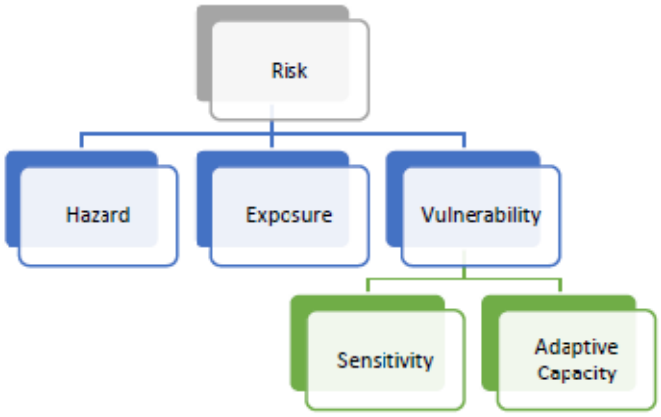

Figure 6.2 Risk arises from interaction of hazard, exposure and vulnerability. Vulnerability is endogenous characteristic of a system and is determined by its sensitivity and adaptive capacity (Source: Vulnerability and Risk Assessment Framework for the Indian Himalayan Region, IISc, Banglore)

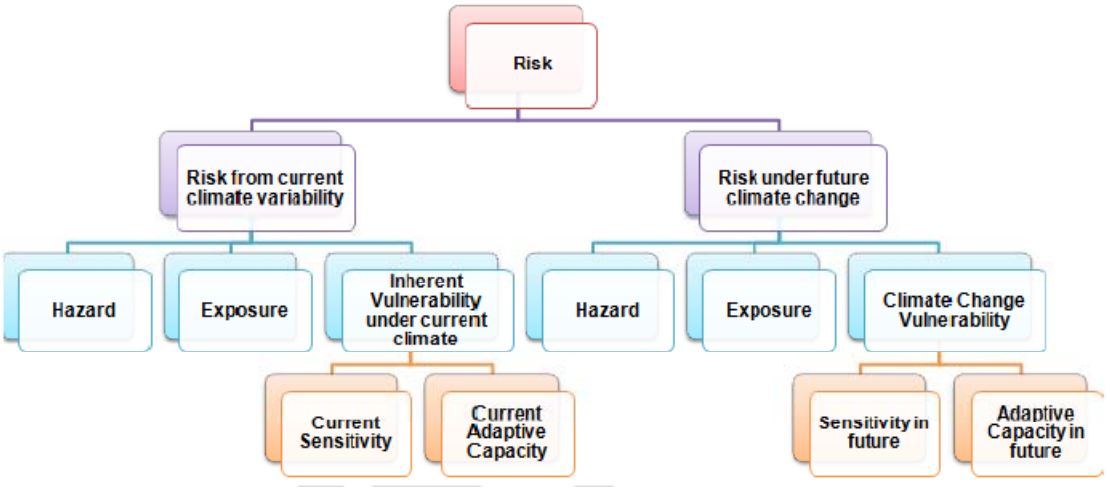

Figure 6.3 Conceptual framework showing the scenarios and elements for assessment of risk and vulnerability according to the IPCC 2014 framework for management of risk. Risk is assessed under current climate variability and under future climate change. Inherent vulnerability is assessed under current climate and in future independent of hazard and exposure. Dealing with the drivers of current inherent vulnerability can potentially reduce current as well as future risks (Source: Source: Vulnerability and Risk Assessment Framework for the Indian Himalayan Region, IISc, Banglore)

The IPCC-2014 framework assesses vulnerability as an endogenous system property independent of exposure. Such treatment of vulnerability eliminates the uncertainties related to the assessment of the nature and dosage of exposure. Further, as the present internal state of a system is assessed and the sources of vulnerability are treated to improve the state of the system that this approach is robust and beneficial whether or not climate change occurs. Such treatment of vulnerability also avoids the chances of maladaptation, and in combination with the benefits of restored health of system, offers a win-win strategy.

Approach to Vulnerability assessment

Vulnerability is a dynamic attribute of a system i.e., it changes depending on its biophysical, socio-cultural, economic and political environment. Assessment of vulnerability thus has to be an iterative process, which is repeated as per the purpose of assessment. Reassessment helps by identification of the new drivers of vulnerability and provides an opportunity to delete the ones that are no longer relevant.

In the current study, the vulnerability assessment for Beas River Basin is being carried out according to the IPCC 2007 framework[1].

Vulnerability to climate change is the degree to which a system has the capacity to sustain the damage due to climate change, including climate variability and extremes. The process of identification, quantification and prioritization of vulnerability in a system is referred to as vulnerability assessment. The study of vulnerability or the degree to which the people, environment or agriculture is affected, requires mainly three types of information: (1) exposure, i.e. patterns of exposure to occurrences of hazards such as droughts and floods; (2) sensitivity, i.e. the degree to which the system can experience damages due to a particular event; and (3) adaptive capacity, i.e. the capacity of a system to recover from disaster and hazards.

The study follow the IPCC Third Assessment Report according to which vulnerability is defined as "The degree to which a system is susceptible to, or unable to cope with, adverse effects of climate change, including climate variability and extremes. Vulnerability is a function of the character, magnitude, and rate of climate variation to which a system is exposed, its sensitivity, and its adaptive capacity" (McCarthy et al.2001). Thus as per this definition, vulnerability has three components: exposure, sensitivity and adaptive capacity.

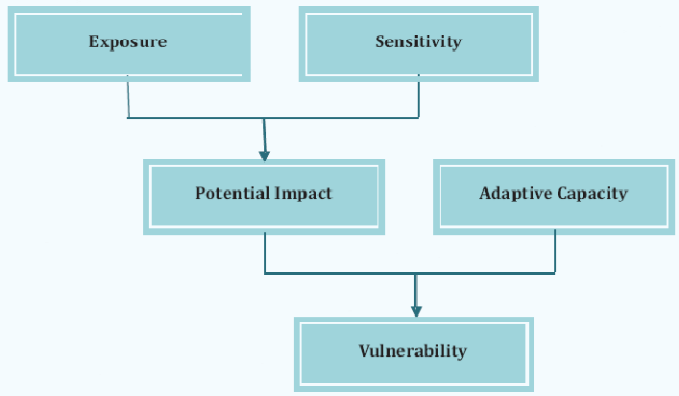

Figure 6.4: Vulnerability

The first two components together represent the potential impact and adaptive capacity is the extent to which these impacts can be averted. Thus vulnerability is potential impact (*I*) minus adaptive capacity (*AC*). This leads to the following mathematical equation for vulnerability:

$$V = f(I - AC)$$

A higher adaptive capacity is associated with a lower vulnerability, while a higher impact is associated with a higher vulnerability. Given the above equation, vulnerability is defined as a function of a range of biophysical and socio-economic factors, aggregated into three components: exposure,

[1] As per the discussions held with the technical expert from Department of Environment, Science & Technology it has been suggested to undertake the vulnerability assessment for Beas River Basin as per IPCC-2007 framework, thereafter, IPCC-2014 framework may be used to undertake study after finalizing the clearcut methodology of vulnerability assessment for all Himalayan States decided by the Indian Institute of Science Banglore.

sensitivity and adaptive capacity to climate variability and change. This study adopted the IPCC framework of vulnerability.

Exposure

The effects of climate change are different at different locations. Some regions will be warmer than the others. Also, the precipitation patterns shift in different areas will be varying resulting in uneven distribution of rainfall. Some regions will see prolonged dry periods and some will experience both warm and intense rainfall. In correlations with the above statements, exposure relates to the degree of climate stress at a particular location. The exposure can also be determined by the long-term climatic changes or the variation in climate including the magnitude and frequency of hazards (O'Brien et al. 2004).

Sensitivity

The relative importance of the effects of climate change differs for different regions, groups and sectors in society. For example, highly intense rainfall may lead to devastating results in some region, whereas the same may not be of much harm in some other region. The degree to which a system is modified or affected by internal, external, or sometimes both disturbances is defined as sensitivity (Gallopin 2003). The measure that reflects the responsiveness of a system to climatic influences determines the degree to which a group will be affected by the environmental stress (SEI 2004).

Adaptive Capacity

Depending upon sensitivity and exposure, the extent of response to the effects of climate change differs across regions. For example, frequent droughts can be addressed by some farmers by using appropriate irrigation technology, whereas other farmers may not be able to afford such technology or may lack the skills to operate it. Therefore, the ability to adapt to certain changes in condition is very important to determine the vulnerability of a system towards the change. Adaptability, coping ability, stability, management capacity, flexibility, robustness and resilience, all together form the ability of a system to adapt to the changes effectively. Therefore, 'Adaptive capacity' is a significant factor in characterizing vulnerability (Smit and Wandel 2006). Adaptive capacity is also defined as the potential or ability of a system, region or community to adjust to the effects or impacts of climate change (IPCC, 2001). Different countries, communities, social groups, individuals and times have different capacities to adapt (IPCC 2001, Smit and Wandel 2006). The adaptive capacity of a system or society is to deal with the changes in conditions to modify its own characteristics and behaviour (Brooks 2003).

The increase in literacy levels enhances the capability of people to access information and cope up with adversities, resulting in reduced vulnerability (Leichenko and O'Brien 2002). The farms with larger agricultural income, land area, farm value assets and latest technology are able to prepare and respond better as compared to the farms with lower technology. Also, the farms with traditional technologies are assumed to be less economically diversified and more vulnerable to climatic events. The availability of facilities like electricity, education, health care, etc. determines the state of poverty in a region. When two different agricultural regions having the same crops and similar climate are compared with each other, the exposure to climate changes might be similar, but the adaptive capacity and vulnerability could be very different based on the socio-economic factors.

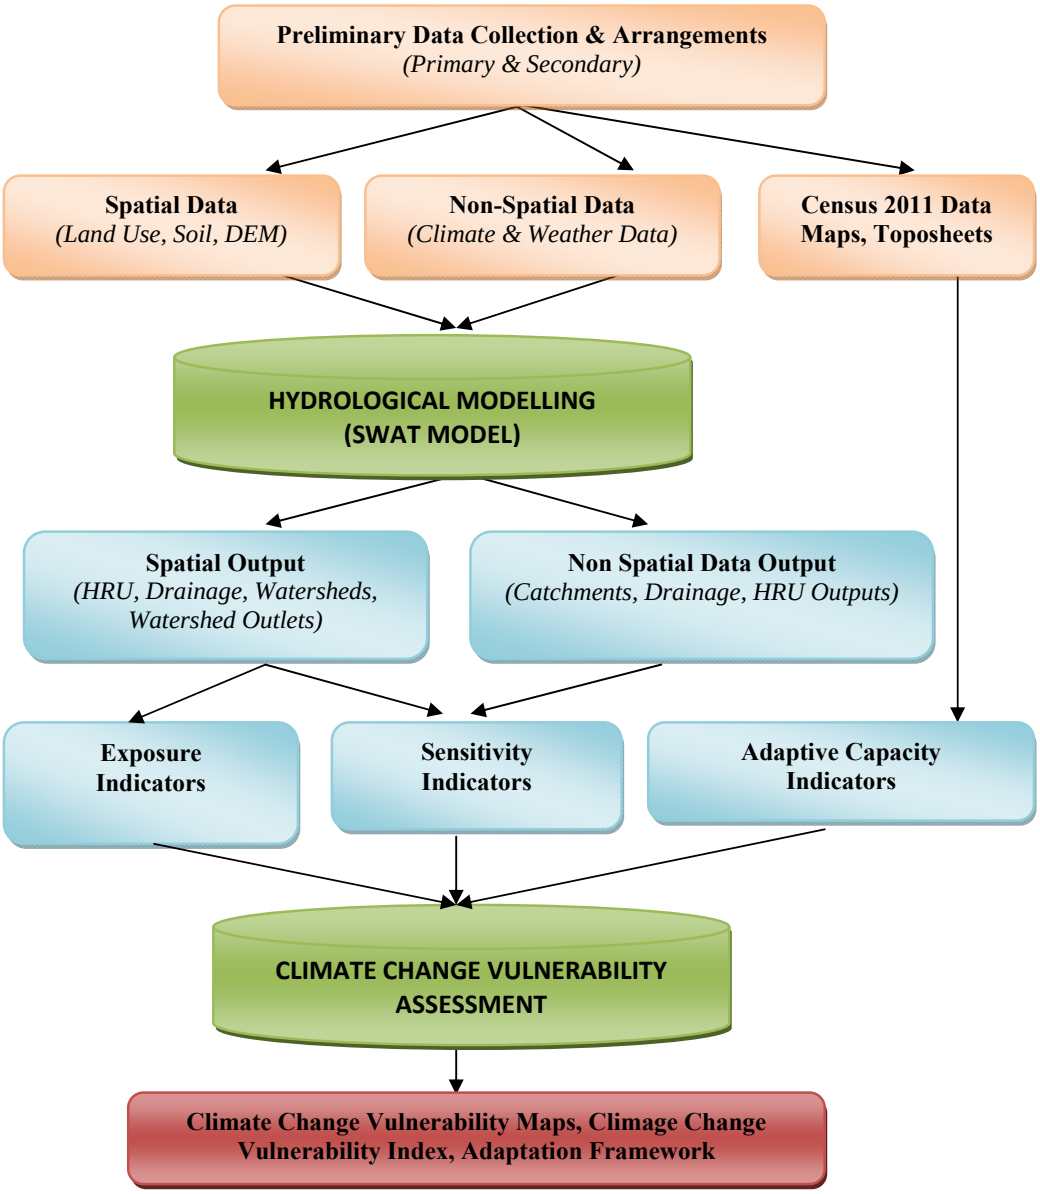
In addition to identification of threat, the analysis of vulnerability also involves resilience or responsiveness of the system and its ability to exploit opportunities and recover from the environmental and climatic changes. Therefore, asset ownership goes hand in hand with vulnerability. The people having more assets are less vulnerable to climate change.

7

Methodology Adopted for Vulnerability Assessment

7. Methodology Adopted for Vulnerability Assessment

Flow Chart
Climate Change Vulnerability Assessment



7.1 Data collection & arrangements

The present study is designed to investigate how climate change is affecting indigenous agricultural based rural community, what makes them vulnerable and how they are coping with the and adapting to the changing climate. The relevant information and data for the study is collected mainly from secondary sources available in publication and reports of various government department and academic institutions. However, some information is collected by conducting primary sample survey at Panchayat & village level.

- **Secondary data Collection**

An extensive review of the available literature on agricultural, horticultural and water resource sector collected from available published documents/reports/databases of the concerned stakeholder department/ organizations.

- **Primary data collection**

Primary data collected through semi-structured questionnaire field survey and interviewing stakeholders in all the selected blocks of district Kangra. Interviewees reflected a cross section of age, gender and livelihoods in the indigenous community, including fulltime agriculturists/horticulturists, worker group etc. During present study primary survey is conducted to find out the impact of changing climate in various sectors like traditional cultivation and extraction of different type of agricultural/ horticultural/livestock produce, availability of water source and other important sectors.

Interaction with panchayat representatives

Interaction with villagers at panchayat

Consultation Meeting with District Administration at DC Office Kangra

Consultation Meeting with District Administration at DC Office Kangra

- **Spatial data collected/ generated**
  - Toposheets from Survey of India
  - Administrative Map collection/generation (District, Block, Panchayat/Village)
  - Land use map collection/generation
  - Soil map collection/ generation
  - Digital Elevation Models

- **Non Spatial data collected/ generated**
  - Data collection survey questionnaire.
  - Panchayat & village wise Demographic data.
  - Agricultural, Horticultural, Irrigation, Water resource data
  - Climate/Weather Data [Temperature, Precipitation, Solar Radiation, Related Humidity etc.]

7.2 Mapping & Data Projection

The expert team assessed the situation and arrived at conclusion that preparation of climate change vulnerability assessment report require/ involves several variables.

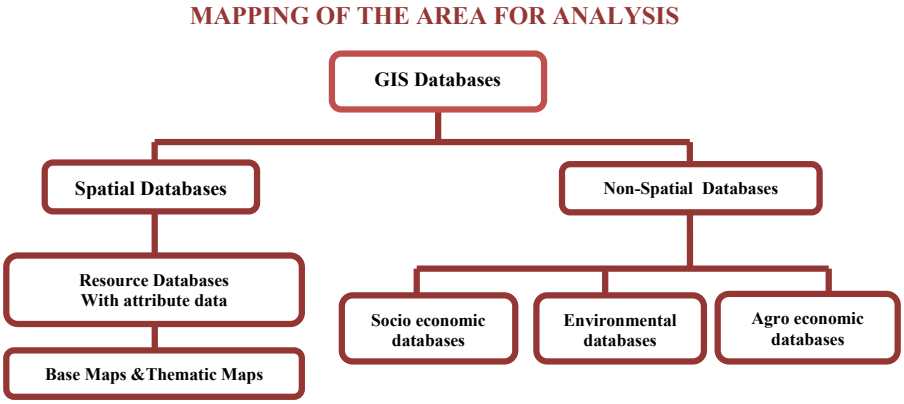


Figure 7.1 Mapping of the Area for Analysis

The mapping and superimposing of data shall not only reduce the volume but also help in area specific problem identification. After primary assessment and identification of thrust areas, climatically vulnerable areas mapping on higher resolution has been prepared for detailed analysis possibly at panchayat level to village level.

7.3 Hydrological Modelling

Hydrology is the study of distribution and movement of water on and below the surface of the earth. When studying the hydrology of a landscape, it is critical to consider the role of environmental changes such as land-use and climate. The implications of land use changes on hydrology have been an area of intense interest to research hydrologists over the last fifty or more years. Issues of land use change affecting hydrology include increasing urbanization, changing vegetative cover, land drainage, and changing agricultural practices.

Hydrological modelling and prediction consists of:

(1) Getting to know the landscape through field visits and expert observation;
(2) Collection of field information to feed into the model, including spatial (e.g. topography, land-use/land-cover, soil), and tabular (e.g. weather and climate) data;
(3) Delineation of the watershed – i.e. mapping drainage areas based on topography;
(4) Simulation of the model to represent and quantify water movement and distribution across the landscape using multiple parameters; and
(5) Parameterization – the process of comparing model generated output with field measured information. The final model helps to quantify the amount of surface runoff, infiltration, evaporation, groundwater recharge, snow melting, evapotranspiration based on a water balance equation.

Predictive hydrological modelling is important for water resource managers, as they require information on the amount of flow required to sustain river ecological processes, and to

ascertain how much water is available for out of stream use (e.g. irrigation, municipal water use).

The predictive capability of a hydrologic model is also important for "what-if" scenario analysis. Scenario analysis allows the modeller to play around with different land-use and management scenarios to come up with the optimal scenario for water conservation and utilization.

Hydrological modelling is becoming increasingly complex due to climate change. One can not deny the fact that developments in computer technology have revolutionized the study of hydrologic systems and water resources management. Several computer-based hydrologic/water quality models have been developed for applications in hydrologic modelling and water resources studies. Distributed parameter models, necessary for basin-scale studies, have large input data requirements. One such model available is the Soil and Water Assessment Tool (SWAT), a distributed parameter model developed by the United States Department of Agriculture.

SWAT was developed to predict the impact of land management practices on water, sediment and agricultural chemical yields in large complex watersheds with varying soils, land use and management conditions over long period of time. SWAT is a small watershed to river basin-scale model to simulate the quality and quantity of surface and ground water and predict the environmental impact of land use, land management practices, and climate change. SWAT is widely used in assessing soil erosion prevention and control, non-point source pollution control and regional management in watersheds. Soil and Water Assessment Tool (SWAT) model (Arnold et al., 1998; Arnold and Fohrer, 2005) has proven to be an effective tool for assessing water resource for a wide range of scales and environmental conditions across the globe.

The SWAT model allows basin to be divided into subbasins/sub-watersheds, which can further be divided into hydrological response units (HRUs) which are a unique combination of soil and land cover (Gosain et al., 2013). This model has been used in various studies with a wide range of applications.

7.3.1 Open Source Interface for SWAT

The drainage system of three developmental blocks of district Kullu contributes to Beas River Basin which further merge into Indus River System. Using SWAT model panchayat/village level micro-watershed maps, drainage maps, hydrological response unit maps developed. An open source GIS interface for the QSWAT Model with Quantum GIS (mapping software) used for modelling. QSWAT uses a suite of programs called Terrain Analysis Using Digital Elevation Models to perform various geo-processing functions. It also interact with QGIS itself, particularly the layers panel which shows legend information, and the map canvas where the maps are displayed. QSWAT accepts any raster or vector and several spatial databases. QSWAT can delineate watersheds with the capabilities of DEM pit (depression) removal using flooding approach, calculation of flow paths and slopes, calculation of contributing areas using single and multiple flow direction methods, delineation of stream networks using contributing area threshold etc.

QSWAT creates a number of database tables from the watershed delineation and HRU (Hydrological Response Unit) creation steps.

7.3.2 Datasets/Model Inputs

- **Spatial data**
  - **Administrative Maps**
    District Boundaries, Block Boundaries and Panchayat/Village Boundaries digitized from available toposheets.

- **DEM (Digital Elevation Model)**
  SRTM (Radar Topography Mission of NASA) Digital Elevation Model data with 30 meter resolution used for drainage and micro-watershed delineation.

- **Land use Land Cover**
  MODIS (Moderate-resolution Imaging Spectro-radiometer) - based Global Land Cover with 500 meter resolution used.

– **Climate/Weather Data (Non-spatial data)**
Following climate/weather data is required:
  - Temperature (C)
  - Precipitation (mm)
  - Wind (m/s)
  - Relative Humidity (fraction)
  - Solar Radiation

SWAT requires hourly data on above perimeters. Long term global data for these parameter is used for hydrological modelling.

7.3.3 SWAT Model Results

– SWAT Model generates micro-watershed drainage maps and following output:

OUTPUT
Area drained by reach (km2).
Average daily streamflow into reach during time step (m3/s).
Average daily streamflow out of reach during time step (m3/s).
Average daily rate of water loss from reach by evaporation during time step (m3/s).
Average daily rate of water loss from reach by transmission through the streambed during time step (m3/s).
Sediment transported with water into reach during time step (metric tons).
Sediment transported with water out of reach during time step (metric tons).
Concentration of sediment in reach during time step (mg/L).
Organic nitrogen transported with water into reach during time step (kg N).
Organic nitrogen transported with water out of reach during time step (kg N).
Organic phosphorus transported with water into reach during time step (kg P).
Organic phosphorus transported with water out of reach during time step (kg P).
Nitrate transported with water into reach during time step (kg N).
Nitrate transported with water out of reach during time step (kg N).
Ammonium transported with water into reach during time step (kg N).
Ammonium transported with water out of reach during time step (kg N).
Nitrite transported with water into reach during time step (kg N).
Nitrite transported with water out of reach during time step (kg N).
Mineral phosphorus transported with water into reach during time step (kg P).
Mineral phosphorus transported with water out of reach during time step (kg P).
Algal biomass transported with water into reach during time step (kg chl-a).
Algal biomass transported with water out of reach during time step (kg chl-a).
Carbonaceous biochemical oxygen demand of material transported into reach during time step (kg O2).
Carbonaceous biochemical oxygen demand of material transported out of reach during time step (kg O2).
Amount of dissolved oxygen transported into reach during time step (kg O2).
Amount of dissolved oxygen transported out of reach during time step (kg O2).
Soluble pesticide transported with water into reach during time step (mg active ingredient)
Soluble pesticide transported with water out of reach during time step (mg active ingredient).
Pesticide sorbed to sediment transported with water into reach during time step (mg active ingredient).
Pesticide sorbed to sediment transported with water out of reach during time step (mg active ingredient).
Loss of pesticide from water by reaction during time step (mg active ingredient).
Loss of pesticide from water by volatilization during time step (mg active ingredient).
Transfer of pesticide from water to river bed sediment by settling during time step (mg active ingredient).
Transfer of pesticide from river bed sediment to water by resuspension during time step (mg active ingredient).
Transfer of pesticide from water to river bed sediment by diffusion during time step (mg active ingredient).
Loss of pesticide from river bed sediment by reaction during time step (mg active ingredient).
Loss of pesticide from river bed sediment by burial during time step (mg active ingredient).
Pesticide in river bed sediment during time step (mg active ingredient).
Number of persistent bacteria transported out of reach during time step (# cfu/100 mL).

Number of less persistent bacteria transported out of reach during time step (# cfu/100 mL).
Conservative metal #1 transported out of reach (kg).
Conservative metal #2 transported out of reach (kg).
Conservative metal #3 transported out of reach (kg).

– SWAT Model also generates micro-watershed maps and following output variables:

OUTPUT
Subbasin number
Daily time step
Area of the subbasin (km2).
Total amount of precipitation falling on the subbasin during time step (mm H2O).
Amount of snow or ice melting during time step (water-equivalent mm H2O).
Potential evapotranspiration from the subbasin during the time step (mm H2O).
Actual evapotranspiration from the subbasin during the time step (mm).
Soil water content (mm). Amount of water in the soil profile at the end of the time period.
Water that percolates past the root zone during the time step (mm).
Surface runoff contribution to streamflow during time step (mm H2O).
Groundwater contribution to streamflow (mm).
Water yield (mm H2O).
Sediment yield (metric tons/ha).
Organic N yield (kg N/ha).
Organic P yield (kg P/ha).
NO3 in surface runoff (kg N/ha).
Soluble P yield (kg P/ha).
Mineral P yield (kg P/ha).

– SWAT Model also generates Hydrological Response Unit (HRU) maps and following output variables:

OUTPUT
Four letter character code for the cover/plant on the HRU. (code from crop.dat file)
Hydrologic response unit number
GIS code reprinted from watershed configuration file (.fig). See explanation of subbasin command (Chapter 2).
Topographically-defined subbasin to which the HRU belongs.
Management number. This is pulled from the management (.mgt) file. Used by the SWAT/GRASS interface to allow development of output maps by landuse/management type.
Daily time step: the julian date, Monthly time step: the month (1-12), Annual time step: 4-digit year, Average annual summary lines: number of years averaged together
Drainage area of the HRU (km2).
Total amount of precipitation falling on the HRU during time step (mm H2O).
Amount of precipitation falling as snow, sleet or freezing rain during time step (water-equivalent mm H2O).
Amount of snow or ice melting during time step (water-equivalent mm H2O).
Irrigation (mm H2O). Amount of irrigation water applied to HRU during the time step.
Potential evapotranspiration (mm H2O). Potential evapotranspiration from the HRU during the time step.
Actual evapotranspiration (soil evaporation and plant transpiration) from the HRU during the time step (mm H2O).
Soil water content (mm H2O). For daily output, this column provides the amount of water in soil profile at beginning of day. For monthly and annual output, this is the average soil water content for the time period. The amount of water in the soil profile at the beginning of the day is used to calculate daily curve number values.
Soil water content (mm H2O). Amount of water in the soil profile at the end of the time period (day, month or year).
Water that percolates past the root zone during the time step (mm H2O). There is usually a lag between the time the water leaves the bottom of the root zone and reaches the shallow aquifer. Over a long period of time, this variable should equal groundwater recharge (PERC = GW_RCHG as time → ∞).
Recharge entering aquifers during time step (total amount of water entering shallow and deep aquifers during time step) (mm H2O).
Deep aquifer recharge (mm H2O). The amount of water from the root zone that recharges the deep aquifer during the time step. (shallow aquifer recharge = GW_RCHG - DA_RCHG)
Water in the shallow aquifer returning to the root zone in response to a moisture deficit during the time step (mm H2O). The variable also includes water uptake directly from the shallow aquifer by deep tree and shrub roots.
Irrigation from shallow aquifer (mm H2O). Amount of water removed from the shallow aquifer for irrigation during the time step.
Irrigation from deep aquifer (mm H2O). Amount of water removed from the deep aquifer for irrigation during the time step.
Shallow aquifer storage (mm H2O). Amount of water in the shallow aquifer at the end of the time period.
Deep aquifer storage (mm H2O). Amount of water in the deep aquifer at the end of the time period.

Surface runoff generated in HRU during time step (mm H2O).
Surface runoff contribution to streamflow in the main channel during time step (mm H2O).
Transmission losses (mm H2O). Water lost from tributary channels in the HRU via transmission through the bed. This water becomes recharge for the shallow aquifer during the time step. Net surface runoff contribution to the main channel streamflow is calculated by subtracting TLOSS from SURQ.
Lateral flow contribution to streamflow (mm H2O). Water flowing laterally within the soil profile that enters the main channel during time step.
Groundwater contribution to streamflow (mm H2O). Water from the shallow aquifer that enters the main channel during the time step. Groundwater flow is also referred to as baseflow.
Water yield (mm H2O). Total amount of water leaving the HRU and entering main channel during the time step. (WYLD = SURQ + LATQ + GWQ – TLOSS – pond abstractions)
Average curve number for time period. The curve number adjusted for soil moisture content.
Average daily air temperature (°C). Average of mean daily air temperature for time period.
Average maximum air temperature (°C). Average of maximum daily air temperatures for time period.
Average minimum air temperature (°C). Average of minimum daily air temperatures for time period.
Soil temperature (°C). Average soil temperature of first soil layer for time period.
Average daily solar radiation (MJ/m2). Average of daily solar radiation values for time period.
Sediment yield (metric tons/ha). Sediment from the HRU that is transported into the main channel during the time step.
Soil loss during the time step calculated with the USLE equation (metric tons/ha). This value is reported for comparison purposes only.
Nitrogen fertilizer applied (kg N/ha). Total amount of nitrogen (mineral and organic) applied in regular fertilizer operations during the time step.
Phosphorus fertilizer applied (kg P/ha). Total amount of phosphorus (mineral and organic) applied in regular fertilizer operations during the time step.
Nitrogen fertilizer auto-applied (kg N/ha). Total amount of nitrogen (mineral and organic) auto-applied during the time step.
Phosphorus fertilizer auto-applied (kg P/ha). Total amount of phosphorus (mineral and organic) auto-applied during the time step.
Nitrogen applied during grazing operation (kg N/ha). Total amount of nitrogen (mineral and organic) added to soil by grazing operation during the time step.
Phosphorus applied during grazing operation (kg P/ha). Total amount of phosphorus (mineral and organic) added to soil by grazing operation during the time step.
Nitrogen applied during continuous fertilizer operation (kg N/ha). Total amount of nitrogen (mineral and organic) added to soil by continuous fertilizer operation during time step.
Phosphorus applied during continuous fertilizer operation (kg P/ha). Total amount of phosphorus (mineral and organic) added to soil by continuous fertilizer operation during time step.
Nitrate added to soil profile by rain (kg N/ha).
Nitrogen fixation (kg N/ha). Amount of nitrogen fixed by legumes during the time step.
Fresh organic to mineral N (kg N/ha). Mineralization of nitrogen from the fresh residue pool to the nitrate (80%) pool and active organic nitrogen (20%) pool during the time step. A positive value denotes a net gain in the nitrate and active organic pools from the fresh organic pool while a negative value denotes a net gain in the fresh organic pool from the nitrate and active organic pools.
Active organic to mineral N (kg N/ha). Movement of nitrogen from the active organic pool to the nitrate pool during the time step.
Active organic to stable organic N (kg N/ha). Movement of nitrogen from the active organic pool to the stable organic pool during the time step.
Fresh organic to mineral P (kg P/ha). Mineralization of phosphorus from the fresh residue pool to the labile (80%) pool (P in solution) and the active organic (20%) pool. A positive value denotes a net gain in solution and active organic pools from the fresh organic pool while a negative value denotes a net gain in the fresh organic pool from the labile and active organic pools.
Organic to labile mineral P (kg P/ha). Movement of phosphorus between the organic pool and the labile mineral pool during the time step. A positive value denotes a net gain in the labile pool from the organic pool while a negative value denotes a net gain in the organic pool from the labile pool.
Labile to active mineral P (kg P/ha). Movement or transformation of phosphorus between the "labile" mineral pool (P in solution) and the "active" mineral pool (P sorbed to the surface of soil particles) during the time step. A positive value denotes a net gain in the active pool from the labile pool while a negative value denotes a net gain in the labile pool from the active pool.
Active to stable P (kg P/ha). Movement or transformation of phosphorus between the "active" mineral pool (P sorbed to the surface of soil particles) and the "stable" mineral pool (P fixed in soil) during the time step. A positive value denotes a net gain in the stable pool from the active pool while a negative value denotes a net gain in the active pool from the stable pool.
Denitrification (kg N/ha). Transformation of nitrate to gaseous compounds during the time step.
Plant uptake of nitrogen (kg N/ha). Nitrogen removed from soil by plants during the time step.
Plant uptake of phosphorus (kg P/ha). Phosphorus removed from soil by plants during the time step.
Organic N yield (kg N/ha). Organic nitrogen transported out of the HRU and into the reach during the time step.
Organic P yield (kg P/ha). Organic phosphorus transported with sediment into the reach during the time step.
Sediment P yield (kg P/ha). Mineral phosphorus sorbed to sediment transported into the reach during the time step.
NO3 in surface runoff (kg N/ha). Nitrate transported with surface runoff into the reach during the time step.

NO3 in lateral flow (kg N/ha). Nitrate transported by lateral flow into the reach during the time step.
NO3 leached from the soil profile (kg N/ha). Nitrate that leaches past the bottom of the soil profile during the time step. The nitrate is not tracked through the shallow aquifer.
NO3 transported into main channel in the groundwater loading from the HRU (kg N/ha).
Soluble P yield (kg P/ha). Soluble mineral forms of phosphorus transported by surface runoff into the reach during the time step.
Soluble phosphorus transported by groundwater flow into main channel during the time step (kg P/ha).
Water stress days during the time step (days).
Temperature stress days during the time step (days).
Nitrogen stress days during the time step (days).
Phosphorus stress days during the time step (days).
Biomass (metric tons/ha). Total biomass, i.e. aboveground and roots at the end of the time period reported as dry weight.
Leaf area index at the end of the time period.
Harvested yield (metric tons/ha). The model partitions yield from the total biomass on a daily basis (and reports it). However, the actual yield is not known until it is harvested. The harvested yield is reported as dry weight.
Number of persistent bacteria in surface runoff entering reach (# cfu/100 mL).
Number of less persistent bacteria in surface runoff entering reach (#cfu/100 mL).
Water table from above the soil profile (mm) (daily output only; not used in tile flow equations)
Water table depth from the bottom of the soil surface (mm) (daily output only; not used in tile flow equations)
Snow water content (mm)
Current soil carbon for first soil layer (kg/ha).
Current soil carbon integrated for all soil layers (kg/ha)
Drain tile flow in soil profile for the day (mm)
Amount of NO3-N in tile flow in HRU (kg N/ha).
Amount of NO3-N in lateral flow in HRU (kg N/ha).

These outcomes is helpful for further identification of various soil and water parameters like water balance, water quality and water scarcity pockets at panchayat/village level. The hydrological results and maps generated is used as inputs for Climate Change Vulnerability Assessment Analysis.

7.4 Climate Change Vulnerability

Index approach methodology to determine Vulnerability has been adopted for analysis. This index is based on several set of indicators that indicates the vulnerability of a region. It produces a single number, which is used to compare vulnerability levels of different regions. Literature on index number construction specifies that there should be good internal correlation between these indicators. The relevance of this criterion depends on the relationship between the indicators and the construct they are supposed to measure. For this we must know whether the index is based on a 'reflexive' or a 'formative' measurement model. In the reflexive measurement model, the construct is thought to influence the indicators. For example, a poverty index is a good example of reflexive measurement because poverty influences the indicators such as literacy; expenditure and so on and all these indicators are correlated. On the other hand in the formative model the indicators are assumed contribute to the construct. In the case of vulnerability index, all the indicators chosen by the researcher have impact on vulnerability of the region to climate change. For example, frequency of extreme events such as flood, drought earth-quakes, and length of coastline all contribute to vulnerability of the region to climate change. Hence vulnerability index is a formative measurement and the indicators chosen need not have internal correlation.

7.4.1 Arrangement of Data

For each component of vulnerability, the collected data is arranged in the form of a rectangular matrix with rows representing regions/areas/panchayats/village and columns representing indicators. Let there be M regions/districts and let us say we have collected K indicators. Let X_{ij} be the value of the indicator *j* corresponding to region *i*. Then the table will have M rows and K columns as shown below:

Panchayat/Village	**Indicator**					
	1	**2**	**-**	**J**	**-**	**K**

1	X_{11}	X_{12}	-	X_{1j}	-	X_{1K}
2	-	-	-	-	-	-
-	-	-	-	-	-	-
L	X_{i1}	X_{i2}	-	X_{ij}	-	X_{iK}
-	-	-	-	-	-	-
M	X_{m1}	X_{M2}	-	X_{Mj}	-	X

7.4.2 Normalization of Indicators using Functional Relationship

Obviously the indicators are in different units and scales. The methodology used in UNDP's Human Development Index (HDI) (UNDP, 2006) is followed to normalize them. That is, in order to obtain figures which are free from the units and also to standardize their values, first they are normalized so that they all lie between 0 and 1. Before doing this, it is important to identify the functional relationship between the indicators and vulnerability. Two types of functional relationship are possible: vulnerability increases with increase (decrease)in the value of the indicator. Assume that higher the value of the indicator more is the vulnerability. For example, suppose we have collected information on change in maximum temperature or change in annual rainfall or diurnal variation in temperature. It is clear that higher the values of these indicators more will be the vulnerability of the region to climate change as variation in climate variables increase the vulnerability. In this case we say that the variables have ↑ functional relationship with vulnerability and the normalization is done using the formula

$$x_{ij} = \frac{X_{ij} - Min_i\{X_{ij}\}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

It is clear that all these scores will lie between 0 and 1. The value 1 will correspond to that region/area/panchayat/village with maximum value and 0 will correspond to the region with minimum value.

On the other hand, consider adult literacy rate. A high value of this variable implies more literates in the region and so they will have more awareness to cope with climate change. So the vulnerability will be lower and adult literacy rate has ↓ functional relationship with vulnerability. For this case the normalized score is computed using the formula

$$y_{ij} = \frac{Max_i\{X_{ij}\} - X_{ij}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

It can be easily checked that $x_{ij} + y_{ij} = 1$ so that y_{ij} can be calculated as $y_{ij} = 1 - x_{ij}$. For the above table the functional relationship of the variables with vulnerability can be given as:

Variables	Functional Relationship
Variance in annual rainfall (mm^2)	↑
Diurnal variance in temperature	↑
Total food grains (tonnes)/Net Sown Area (NSA)	↓
Cropping Intensity	↓
Agrl. labourers / Ha of NSA	↓
Literacy Rate (%)	↓

7.4.3 Construction of Vulnerability Index

Construction of vulnerability index consists of several steps. First is the selection of study area which consists of several regions. In our case we have selected the area of Beas River Basin covering fifteen development block of district Kangra i.e. Baijnath, Bhawarna, Dehra, Dharamshala, Fatehpur, Indora, Kangra, Lambagaon, Nagrota Bagwan, Nagrota Surian,

Nurpur, Panchrukhi, Pragrpur, Rait, Sulah. In each region a set of indicators have been selected for each of the three components of vulnerability i.e. Exposure, Sensitivity, Adaptive Capacity. The indicators have been selected based on the availability of data and previous research. Since vulnerability is dynamic over period, it is important that all the indicators relate to the particular year selected. We have tried to assess vulnerability assessment over the years, depending upon the availability of data for each year for all the indicators in each block that too at village level.

After computing the normalized scores the index is constructed by giving either equal weights to all indicators/components. When equal weights are given we use simple average of all the normalized scores to construct the vulnerability index by using the formula:

$$V = f(I\text{-}AC)$$

The first two components together represent the potential impact and adaptive capacity is the extent to which these impacts can be averted. Thus vulnerability is potential impact (*I*) minus adaptive capacity (*AC*).

Finally, the Vulnerability Indexes will be used to rank the different regions in terms of vulnerability. A region with highest index is said to be most vulnerable and it is given the rank1, the region with next highest index is assigned rank 2 and so on.

7.5 Climate Change Adaptation Framework

Based upon the results of the climate change vulnerability analysis a village/ panchayat level climate change vulnerability maps will be generated and all the villages/ panchayates will be placed under six levels of vulnerability i.e. extreme, very high, high, moderate, low and very low. Based upon the position of the villages/ panchayates corresponding to the vulnerability values/ level the suggestive adaptive plan/framework will be formulated.

8

Hydrological Modelling Outputs

8 Hydrological Modelling Outputs

The project basically aims to formulate climate change adaptation plan based upon the climate change vulnerability assessment at village/ panchayat level of district Kangra. Through earlier studies it has been observed that Kangra district is climatically vulnerable, but in absence of availability regional information on water balance, water quality and water yield several challenges remain unattended. Climate changes have had marked impacts on the natural systems. However its impact will be significant with the hydrological cycle, therefore, hydrological modelling is essential in the analysing process. It is agreed that climate change have adverse impacts on socio-economic development. The hydrological modelling is a valuable tool to aid in quantification of water quality and yield. Since the study is being carried out in fifteen developmental blocks of the district Kangra at panchayat/village level, it is appropriate to narrow down the scale from catchment to micro-watershed level.

8.1 Open Source Interface Management (QGIS & QSWAT)

The Open-source geospatial techniques is used to prepare various thematic maps of study area influence land use, soil, drainage, and slope used as input for SWAT model. SWAT model proves as an effective tool in simulating the hydrology of large basins at watershed scale. This gives simulated results of each parameter. The estimated parameters therefore used for many purposes of study such as agricultural water management, climate change impact assessment, flow forecasting, water quality assessment etc. This water balance study minimizes risk of drought and mismanagement, and hence lead to a proper utilization of water resource available. Water regime of the specific area is well understood by assessment of resources. Water balance is best way of determining availability of water in different components of hydrological cycle and changes in between these components.

QGIS (Quantum GIS) is a cross-platform free and open-source desktop geographic information system (GIS) application that is used for creating, viewing, editing, and analysis of geospatial data. Block boundaries, Census villages and other maps are developed using QGIS.

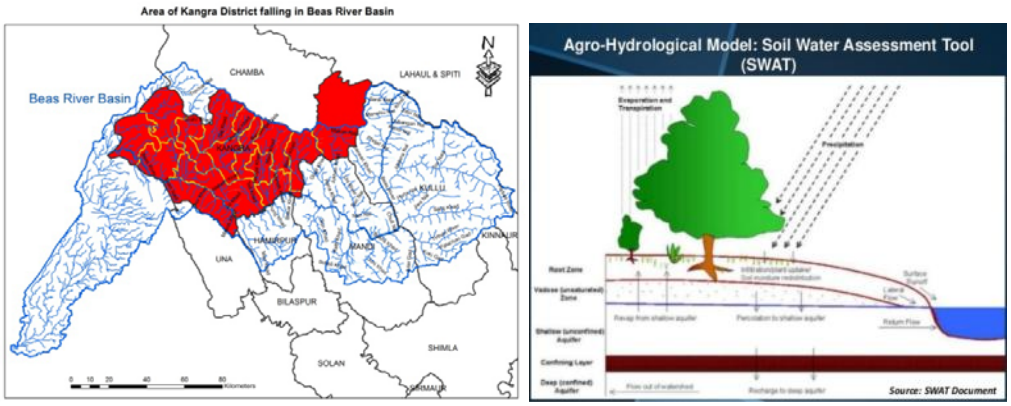

Figure 8.1 QGIS Application Interface & Hydrological Model

An open source GIS interface for the QSWAT Model with Quantum GIS (mapping software) is used for hydrological modelling.

8.2 Datasets/Model Inputs (Spatial & Temporal)

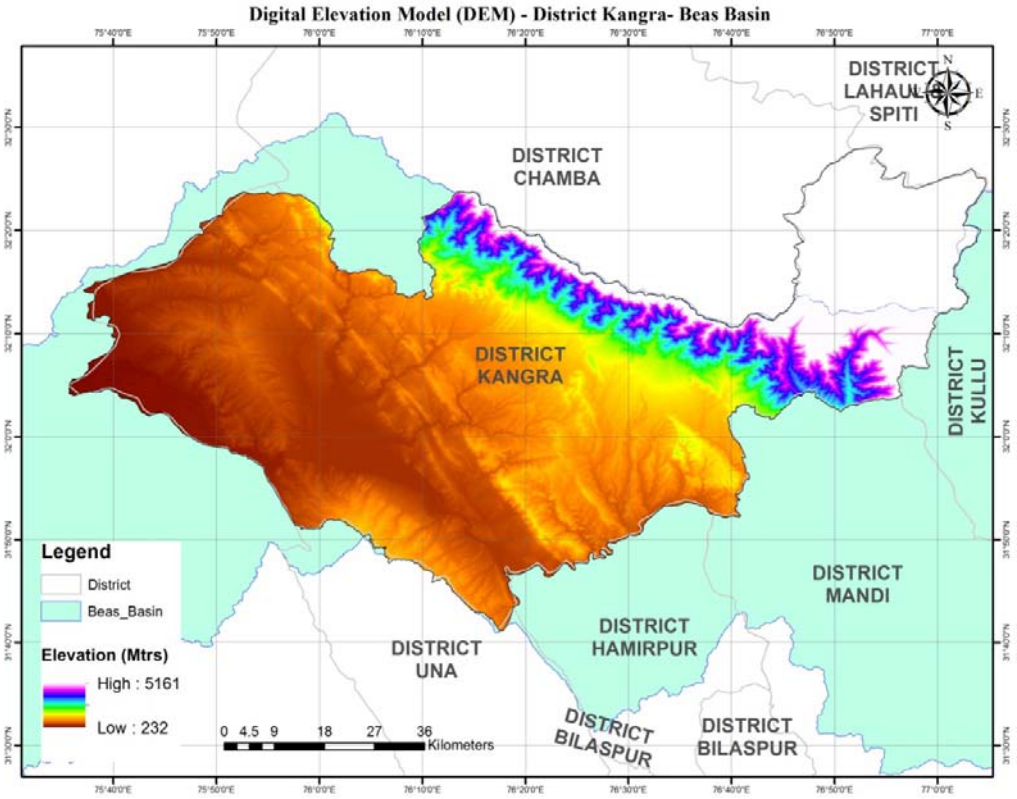
Spatial data

- **Administrative Maps**

Digitization of District, Blocks, Village map boundaries of district Kangra toposheets of Survey of India prepared on 1:50,000 scales for the use of general public/civilians for supporting development activities in the country. Technically maps of this series are based on WGS-84 Datum and UTM Projection.

- **DEM (Digital Elevation Model)**

The Digital Elevation Model (DEM) used in this study is taken from National Aeronautics and Space Administration (NASA) Shuttle Radar Topography Mission (SRTM), at 3 arc second (30 meter resolution). SRTM generated elevation data for near global scale. The USGS has begun to distribute global Shuttle Radar Topography Mission (SRTM) elevation data at 1 arc-second (~30m) resolution. Previously SRTM data at this resolution have only been available for the US and its territories.



Map 8.2 Digital Elevation Model (Beas Basin - District Kangra)

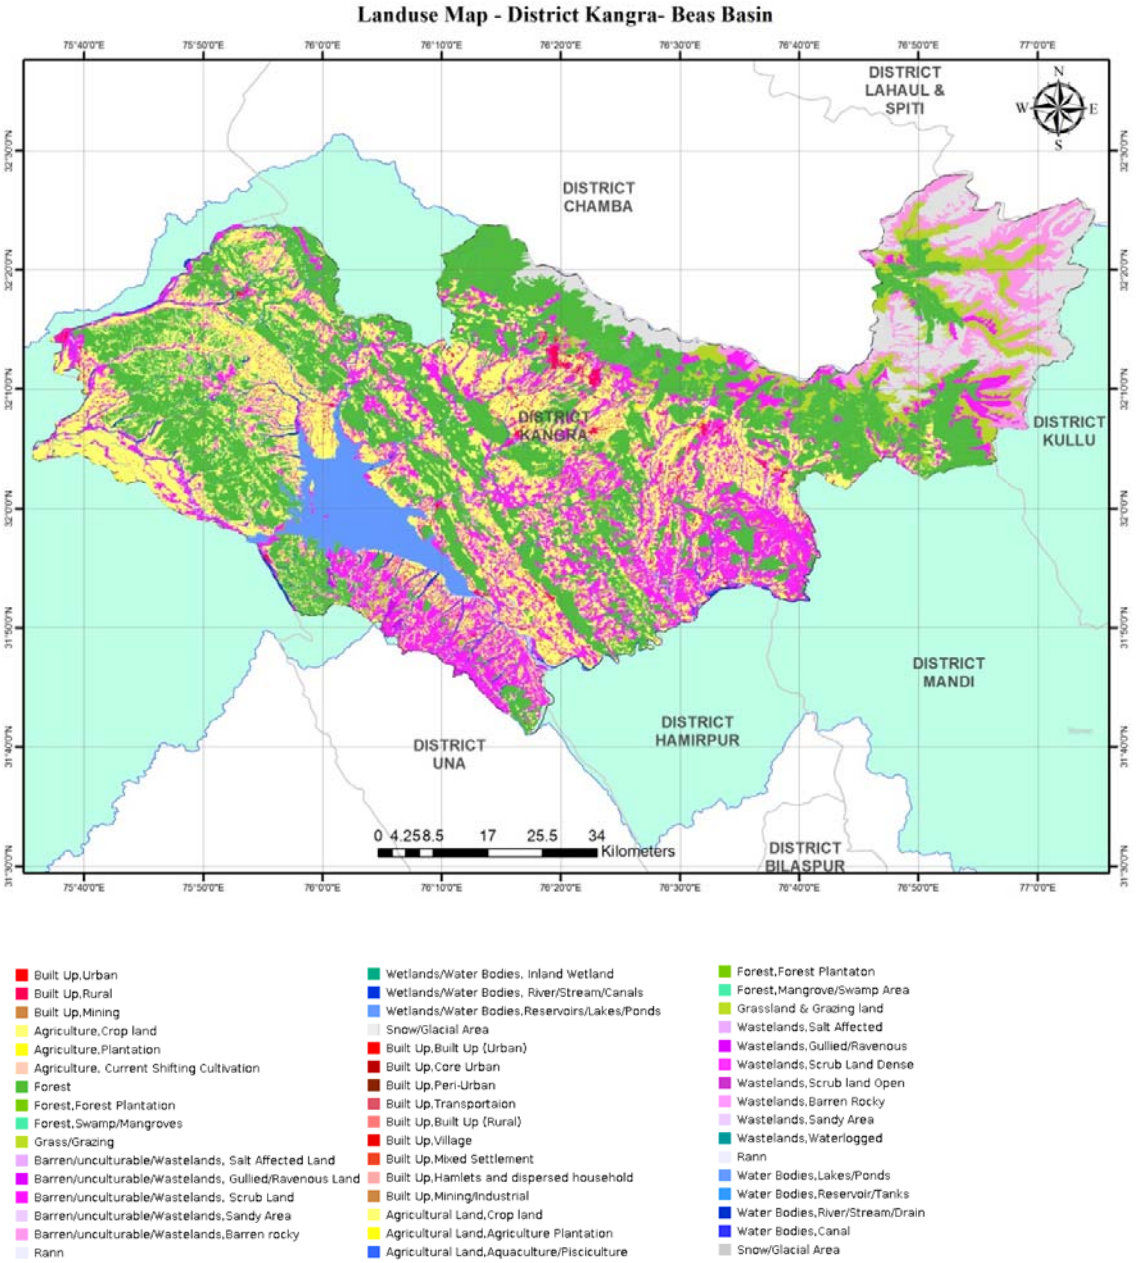
The above map shows the Digital Elevation Model Map of Beas Basin falling in district Kangra. The minimum elevation values are 232 mtrs. and maximum elevation values are 5161 meters.

- **Land use Land Cover & Soil Map**

Maps that reflect the land resources and types of land use in the national economy. Land use maps are subdivided into land resource, land in service, and agricultural land use maps. Land use maps are the basis for the registration and qualitative and economic evaluation (cadastres) of land resources. They show the relationship between lands in service and natural conditions, knowledge of which is essential for scientific planning of the rational use of land.

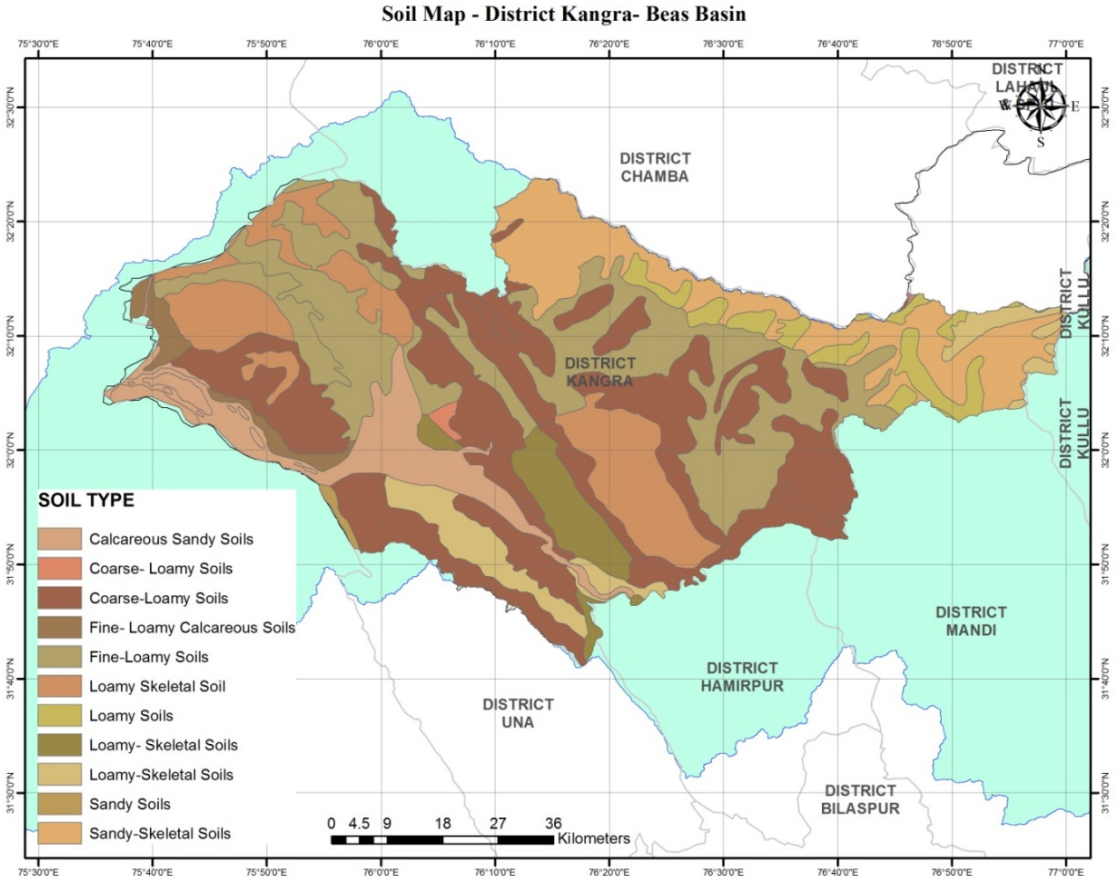
Land use data for hydrological modelling and climate change assessment studies was obtained from the U.S. Geological Survey (USGS) Land Cover Institute (LCI), i.e. Global Land Cover 2000 (GLC 2000) and Thematic Services, Bhuvan - LULC

Vector data of 2005-06, Multi-temporal satellite data of 2011-12 from Resourcesat-2 LISS III



Map 8.3 Landuse Map

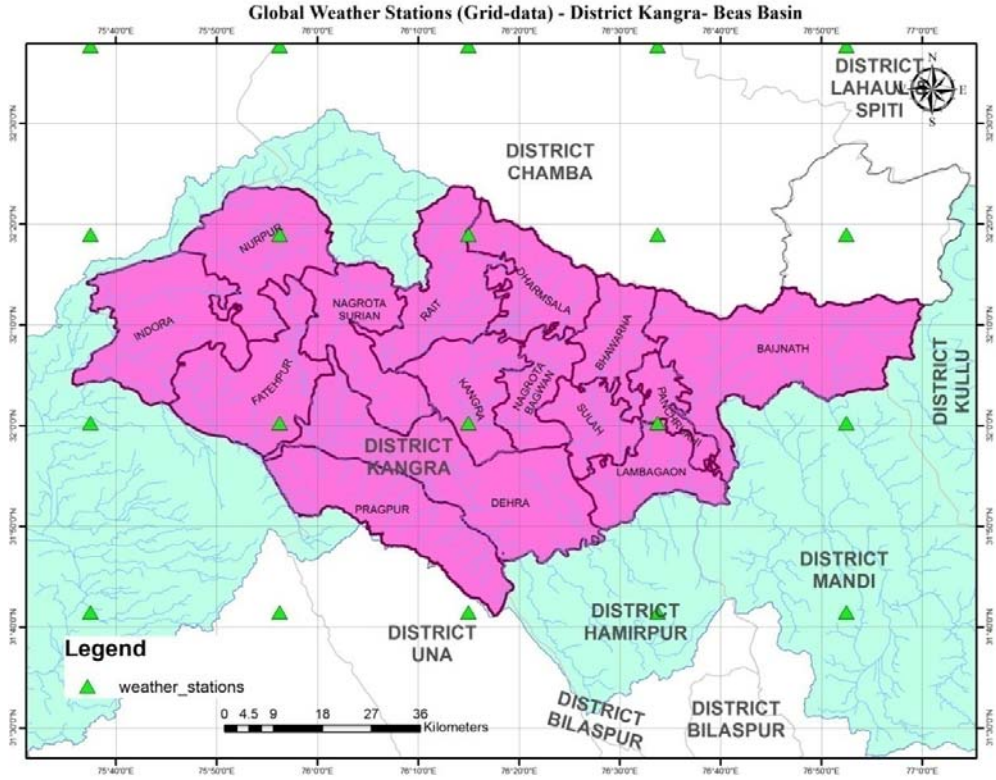
The district is comprised of many fertile valleys as well as high elevation areas. The cultivation is possible in small terraces of holdings in the high hills and the stream/khad basins in most parts of the district.



Map 8.4 Soil Map

– **Climate/Weather Data (Non-spatial data)**
Following climate/weather data has been acquired to run SWAT:
  - Temperature (C)
  - Precipitation (mm)
  - Wind (m/s)
  - Relative Humidity (fraction)
  - Solar Radiation

SWAT requires hourly data on above perimeters. Long term global data for these parameter has been used for hydrological modelling.



Map 8.5 Weather Station Location Map

The National Centers for Environment Prediction (NCEP) Climate Forecast System analysis (CFSR) developed a 34 year climate data sets (1979 to 2013). The CFSR integrated two types of precipitation data sets for land area which are the CPC Merged Analysis of Precipitation (CMAP) with 2.5^{o} resolution and the CPC unified global daily gauge analysis data at 0.5^{o} resolution. Climate data sets for the study area such as precipitation, solar radiation, relative humidity, air temperature, wind speed was obtained from the CFSR.

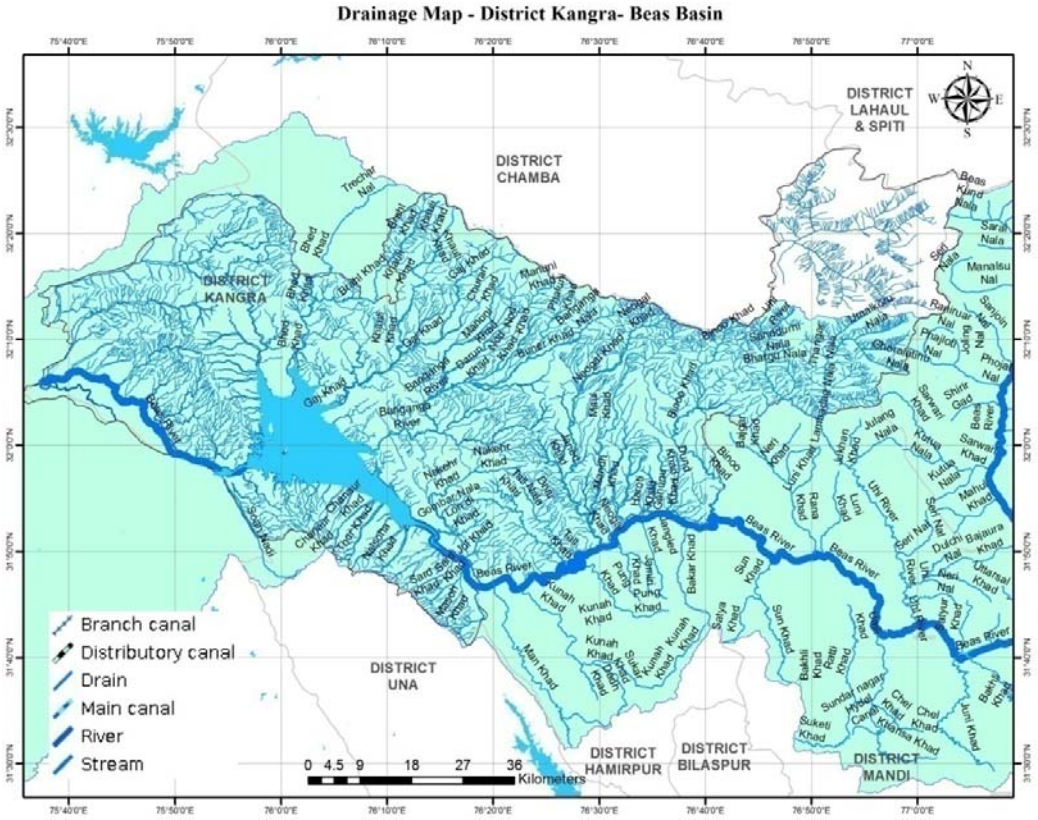
The weather data for station nearby study area was downloaded from http://globalweather.tamu.edu site. The daily data such as precipitation (mm), Temperature (^{o}C), Wind velocity (m/s) and solar radiation (MJ/ m2) available for station has been used. To generate weather database for QSWAT input, various parameters related temperature, precipitation and dew point temperatures were calculated. Calculation of TMPMX, TMPMN, TMPSTDMX, SOLARAV, WNDAV has been carried out with the help of Microsoft excel. Then all the results have been copied to the WGEN_WatershedGan.xls file.

8.3 Watershed Delineation & SWAT Model Run

Watershed delineation based on digital elevation models (DEMs) is the prerequisite to set up SWAT model. Based on QGIS and QSWAT, improved DEM-based method and pre-defined method applied in watershed delineation. In the first method, “Burn-in” and drawing reach and sub-basin boundary manually applied. First, the digital channel network (DCN) was imported using the “Burn-in” function, and the streams and sub-basins delineated based on DEM and DCN. Then the “watershed” and “reach” layers edited in QGIS, where the location, range, and hydrologic connection could be adjusted.

8.3.1 Beas River Basin – Kangra District

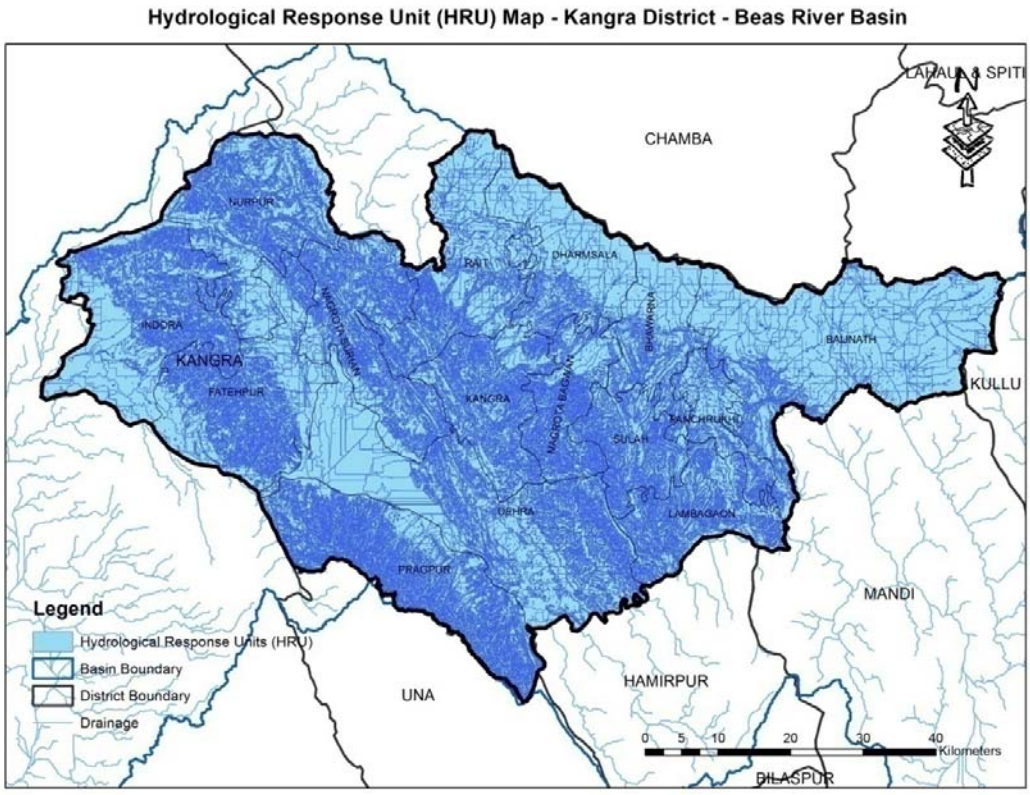
The district is drained by a number of perennial and non-perennial streams which are tributaries of Beas river.



Map 8.6 Drainage Map

Hydrological Response Unit (HRU)

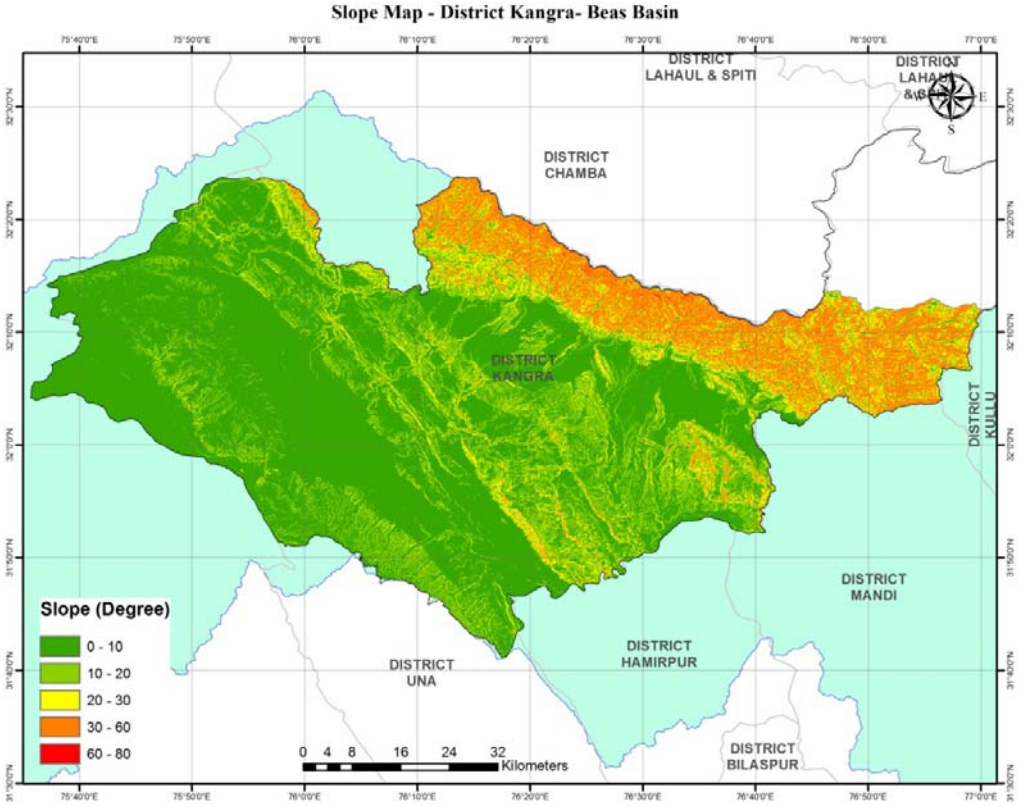
The Soil and Water Assessment Tool (SWAT) is widely used to relate farm management practices to their impacts on surface waters at the watershed scale, yet its smallest spatial unit is not generally defined by physically meaningful boundaries. The hydrologic response unit (HRU) is the smallest spatial unit of the model, and the standard HRU definition approach lumps all similar land uses, soils, and slopes within a subbasin based upon user-defined thresholds.



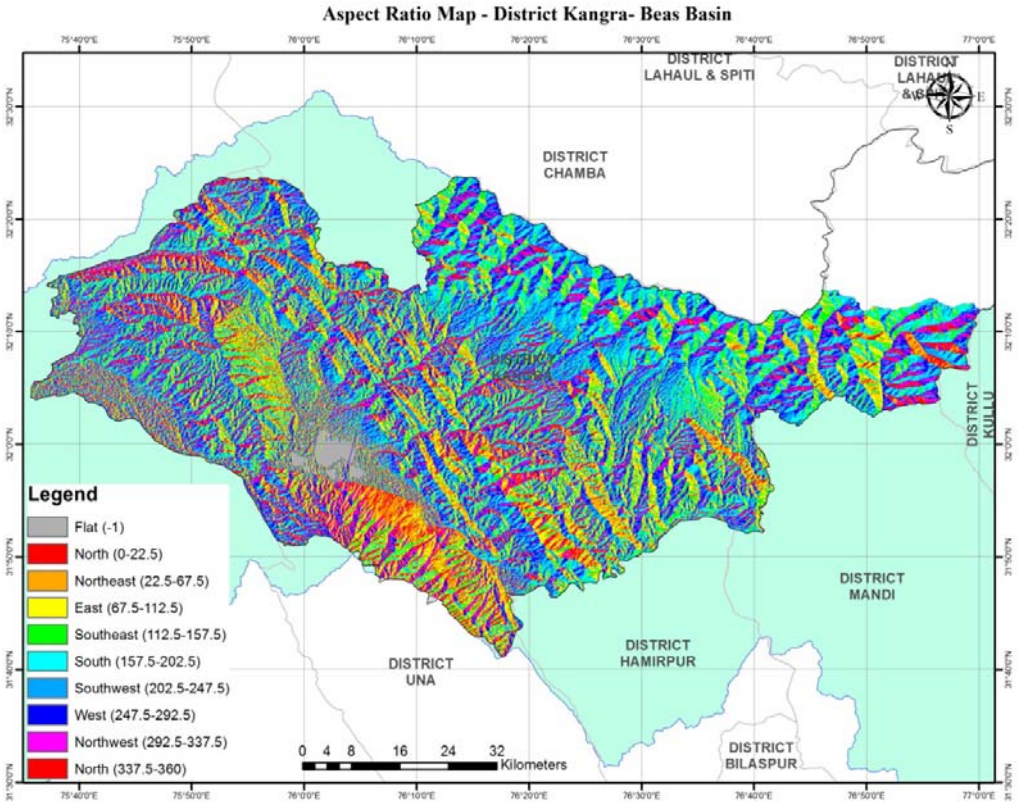
Map 8.7 Hydrological Response Unit Map

Average Hill Slope (in Degree) & Aspect Ratio

The slope map for each basin using Digital Elevation Model were also calculated/ generated through SWAT modelling. The slope (in Degree) output generated for all river basins of the study area i.e. fifteen blocks of Kangra district further clubbed. Thereafter, the average degree of slope for each census village is calculated to be used as indicator for Sensitivity to further calculate vulnerability:



Map 8.8 Kangra- Beas River Basin – Slope Map



Map 8.9 Kangra - Beas River Basin –Aspect Ratio Map

8.4 Hydrological Model Results & Conclusions

It is a fact that the demand for water has already increased manifold over the years due to urbanization, agriculture expansion, increasing population, rapid industrialization and economic development. Presently, changes in the cropping pattern and land-use pattern, overexploitation of water resources, and changes in irrigation and drainage systems are changing the hydrological cycle with many climatic reasons and river basins of the district Kangra.

As per the working group presentation of the IPCC 5th Assessment report, there is medium confidence that the Indian summer monsoon circulation will weaken, but this will be compensated by increased atmospheric moisture content, leading to more precipitation. There is medium confidence that the increase of the Indian summer monsoon rainfall and its extremes throughout the 21st century will be the largest among all monsoons. Studies based on the observed precipitation records of India Meteorological Department (IMD) have shown that the occurrence of extreme precipitation events and their variability has already gone up in many parts of India.

The possible impacts of climate change on water resources of the river basins of Kullu district have been assessed using the hydrologic model QSWAT (Quantum Soil and Water Assessment Tool). The required input/ information on terrain, soil profile, land use area and weather data obtained from the global resources have been provided to the model.

The potential impacts of climate change on water yield and other hydrologic budget components are quantified by performing SWAT hydrological modelling with current climate scenarios for the regional systems.

Detailed outputs have been analyzed with respect to the two major water balance components of water yield and actual evapo-transpiration (ET) that are highly influenced by the weather conditions dictated by temperature and allied parameters. Majority of the river systems show increase in the precipitation at the basin level.

The major reason for such an increase in ET is on two accounts:
(i) Increase in the temperature and
(ii) Increase in precipitation, which enhances the opportunity of ET.

Evapo-transpiration is a very important component of water balance with respect to the biomass and agricultural activities. The potential evapo-transpiration is driven by the weather conditions, but the actual evapo-transpiration is also dependent on the moisture conditions prevalent under the weather conditions (assuming that the land-use and soil characteristics are not changing). The outcome of actual evapo-transpiration has been obtained after the continuous simulation on daily basis for all the sub-basins of various river systems by using QSWAT model.

The implications of changes in precipitation have also been quantified in the form of resulting water yields through the SWAT modelling exercise. The response of water yield is dependent on a combination of factors such as terrain, land use, soil type, and weather conditions. It may be observed that in the case of river systems of district Kangra, there is an improvement in the average water yield this is because of melting of snow glaciers due to increase in average temperature.

After delineating the basin-wise watershed map using QSWAT taking Digital Elevation Model (DEM) as input data, the additional required inputs i.e. soil map, land use map and weather data for the period of 34 years (1979-2013) is provided to SWAT model. After running the model the watershed wise maps & results/output on following parameters are generated:

Output generated on each monitoring point of the watershed drainage

S.NO.	VARIABLE	DEFINITION
1	RCH	Reach number.
2	GIS	GIS number reprinted from watershed configuration (.fig) file.
3	MON	Daily time step: the julian date, Monthly time step: the month (1-12), Annual time step: 4-digit year, Average annual summary lines: number of years averaged together
4	AREA	Area drained by reach (km2).
5	FLOW_IN	Average daily streamflow into reach during time step (m3/s).
6	FLOW_OUT	Average daily streamflow out of reach during time step (m3/s).
7	EVAP	Average daily rate of water loss from reach by evaporation during time step (m3/s).
8	TLOSS	Average daily rate of water loss from reach by transmission through the streambed during time step (m3/s).
9	SED_IN	Sediment transported with water into reach during time step (metric tons).
10	SED_OUT	Sediment transported with water out of reach during time step (metric tons).
11	SEDCONC	Concentration of sediment in reach during time step (mg/L).
12	ORGN_IN	Organic nitrogen transported with water into reach during time step (kg N).
13	ORGN_OUT	Organic nitrogen transported with water out of reach during time step (kg N).
14	ORGP_IN	Organic phosphorus transported with water into reach during time step (kg P).
15	ORGP_OUT	Organic phosphorus transported with water out of reach during time step (kg P).
16	NO3_IN	Nitrate transported with water into reach during time step (kg N).
17	NO3_OUT	Nitrate transported with water out of reach during time step (kg N).
18	NH4_IN	Ammonium transported with water into reach during time step (kg N).
19	NH4_OUT	Ammonium transported with water out of reach during time step (kg N).
20	NO2_IN	Nitrite transported with water into reach during time step (kg N).
21	NO2_OUT	Nitrite transported with water out of reach during time step (kg N).
22	MINP_IN	Mineral phosphorus transported with water into reach during time step (kg P).
23	MINP_OUT	Mineral phosphorus transported with water out of reach during time step (kg P).
24	ALGAE_IN	Algal biomass transported with water into reach during time step (kg chl-a).
25	ALGAE_OUT	Algal biomass transported with water out of reach during time step (kg chl-a).
26	CBOD_IN	Carbonaceous biochemical oxygen demand of material transported into reach during time step (kg O2).
27	CBOD_OUT	Carbonaceous biochemical oxygen demand of material transported out of reach during time step (kg O2).
28	DISOX_IN	Amount of dissolved oxygen transported into reach during time step (kg O2).
29	DISOX_OUT	Amount of dissolved oxygen transported out of reach during time step (kg O2).
30	SOLPST_IN	Soluble pesticide transported with water into reach during time step (mg active ingredient)
31	SOLPST_OUT	Soluble pesticide transported with water out of reach during time step (mg active ingredient).
32	SORPST_IN	Pesticide sorbed to sediment transported with water into reach during time step (mg active ingredient).
33	SORPST_OUT	Pesticide sorbed to sediment transported with water out of reach during time step (mg active ingredient).
34	REACTPST	Loss of pesticide from water by reaction during time step (mg active ingredient).
35	VOLPST	Loss of pesticide from water by volatilization during time step (mg active ingredient).
36	SETTLPST	Transfer of pesticide from water to river bed sediment by settling during time step (mg active ingredient).
37	RESUSP_PST	Transfer of pesticide from river bed sediment to water by resuspension during time step (mg active ingredient).
38	DIFFUSEPST	Transfer of pesticide from water to river bed sediment by diffusion during time step (mg active ingredient).
39	REACBEDPST	Loss of pesticide from river bed sediment by reaction during time step (mg active ingredient).
40	BURYPST	Loss of pesticide from river bed sediment by burial during time step (mg active ingredient).
41	BED_PST	Pesticide in river bed sediment during time step (mg active ingredient).
42	BACTP_OUT	Number of persistent bacteria transported out of reach during time step (# cfu/100 mL).
43	BACTLP_OUT	Number of less persistent bacteria transported out of reach during time step (# cfu/100 mL).
44	CMETAL#1	Conservative metal #1 transported out of reach (kg).
45	CMETAL#2	Conservative metal #2 transported out of reach (kg).
46	CMETAL#3	Conservative metal #3 transported out of reach (kg).
47	TOT_N	Total nitrogen transported with water out of reach during time step (kg N).
48	TOT_P	Total phosphorus transported with water out of reach during time step (kg P).

S.NO.	VARIABLE	DEFINITION
49	NO3CONC	Nitrate concentration transported with water out of reach during time step (mg/l).

Output generated for each watersheds of the river basin

S.NO.	VARIABLE	DEFINITION
1	SUB	Subbasin number.
2	GIS	GIS code reprinted from watershed configuration file (.fig). See explanation of subbasin command.
3	MON	Daily time step: the julian date, Monthly time step: the month (1-12), Annual time step: 4-digit year, Average annual summary lines: number of years averaged together
4	AREA	Area of the subbasin (km2).
5	PRECIP	Total amount of precipitation falling on the subbasin during time step (mm H2O).
6	SNOMELT	Amount of snow or ice melting during time step (water-equivalent mm H2O).
7	PET	Potential evapotranspiration from the subbasin during the time step (mm H2O).
8	ET	Actual evapotranspiration from the subbasin during the time step (mm).
9	SW	Soil water content (mm). Amount of water in the soil profile at the end of the time period.
10	PERC	Water that percolates past the root zone during the time step (mm). There is potentially a lag between the time the water leaves the bottom of the root zone and reaches the shallow aquifer. Over a long period of time, this variable should equal groundwater percolation.
11	SURQ	Surface runoff contribution to streamflow during time step (mm H2O).
12	GW_Q	Groundwater contribution to streamflow (mm). Water from the shallow aquifer that returns to the reach during the time step.
13	WYLD	Water yield (mm H2O). The net amount of water that leaves the subbasin and contributes to streamflow in the reach during the time step. (WYLD = SURQ + LATQ + GWQ – TLOSS – pond abstractions)
14	SYLD	Sediment yield (metric tons/ha). Sediment from the subbasin that is transported into the reach during the time step.
15	ORGN	Organic N yield (kg N/ha). Organic nitrogen transported out of the subbasin and into the reach during the time step.
16	ORGP	Organic P yield (kg P/ha). Organic phosphorus transported with sediment into the reach during the time step.
17	NSURQ	NO3 in surface runoff (kg N/ha). Nitrate transported by the surface runoff into the reach during the time step.
18	SOLP	Soluble P yield (kg P/ha). Phosphorus that is transported by surface runoff into the reach during the time step.
19	SEDP	Mineral P yield (kg P/ha). Mineral phosphorus attached to sediment that is transported by surface runoff into the reach during the time step.
20	LATQ	Lateral flow contribution to streamflow during timestep (mm H2O)
21	LAT_Q_NO3	Lateral flow nitarte contributions to streamflow (kh/ha)
22	GWMO3	Groundwater nitarte contributions to streamflow (kh/ha)
23	CHOLA	CHLOROPHYLL-A LOADING ON DAY FROM SUBBASIN (kg chl-a) (only printed for daily – other options print 0.0)
24	CBODU	CARBONACEOUS BIOLOGICAL OXYGEN DEMAND LOADING ON DAY FROM SUBBASIN (kg cbod) (only printed for daily – other options print 0.0)
25	DOXQ	DISSOLVED OXYGEN LOADING ON DAY FROM SUBBASIN (kg O2) (only printed for daily – other options print 0.0)
26	TNO3	NO3 IN TILE FLOW IN DAY IN SUBBASIN (kg N/ha)

Output generated for each Hydrological Response Unit

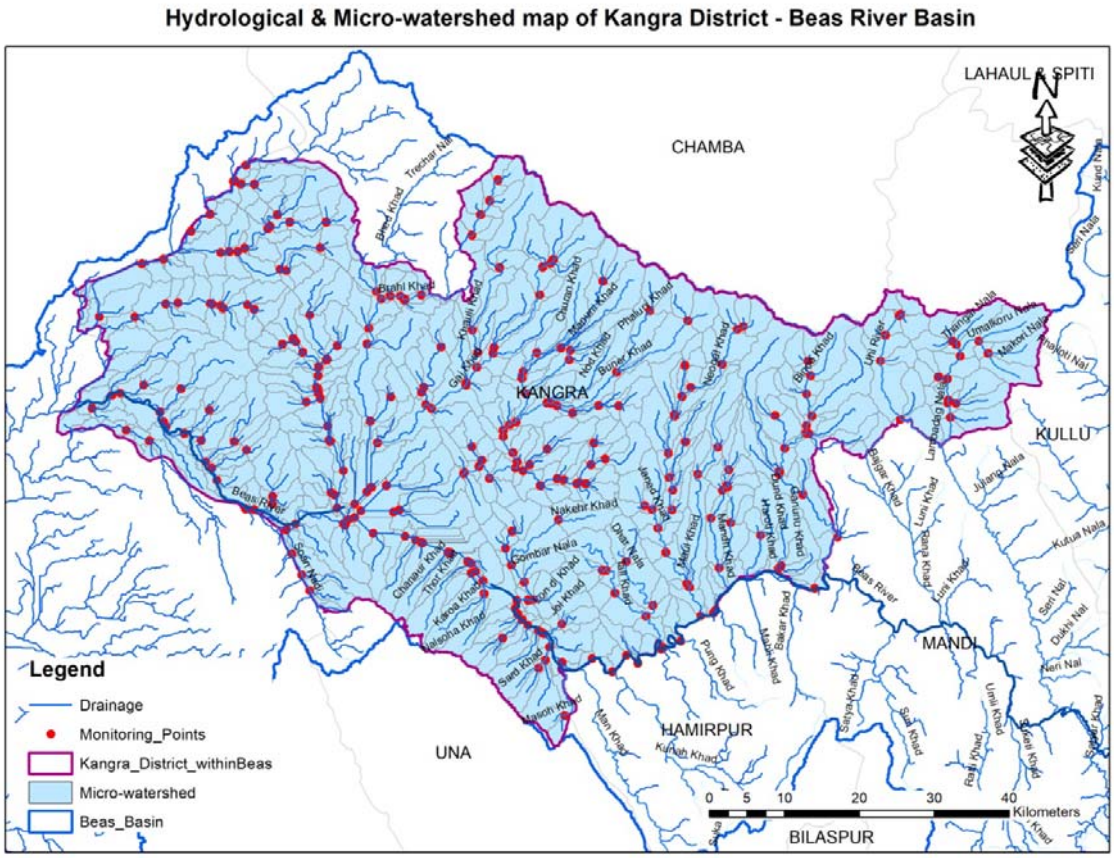
S.NO.	VARIABLE	DEFINITION
1	LULC	Four letter character code for the cover/plant on the HRU. (code from crop.dat file)
2	HRU	Hydrologic response unit number
3	GIS	GIS code reprinted from watershed configuration file (.fig). See explanation of subbasin command (Chapter 2).
4	SUB	Topographically-defined subbasin to which the HRU belongs.
5	MGT	Management number. This is pulled from the management (.mgt) file. Used by the SWAT/GRASS interface to allow development of output maps by landuse/management type.
6	MON	Daily time step: the julian date, Monthly time step: the month (1-12), Annual time step: 4-digit year, Average annual summary lines: number of years averaged together

S.NO.	VARIABLE	DEFINITION
7	AREA	Drainage area of the HRU (km2).
8	PRECIP	Total amount of precipitation falling on the HRU during time step (mm H2O).
9	SNOFALL	Amount of precipitation falling as snow, sleet or freezing rain during time step (water-equivalent mm H2O).
10	SNOMELT	Amount of snow or ice melting during time step (water-equivalent mm H2O).
11	IRR	Irrigation (mm H2O). Amount of irrigation water applied to HRU during the time step.
12	PET	Potential evapotranspiration (mm H2O). Potential evapotranspiration from the HRU during the time step.
13	ET	Actual evapotranspiration (soil evaporation and plant transpiration) from the HRU during the time step (mm H2O).
14	SW_INIT	Soil water content (mm H2O). For daily output, this column provides the amount of water in soil profile at beginning of day. For monthly and annual output, this is the average soil water content for the time period. The amount of water in the soil profile at the beginning of the day is used to calculate daily curve number values.
15	SW_END	Soil water content (mm H2O). Amount of water in the soil profile at the end of the time period (day, month or year).
16	PERC	Water that percolates past the root zone during the time step (mm H2O). There is usually a lag between the time the water leaves the bottom of the root zone and reaches the shallow aquifer. Over a long period of time, this variable should equal groundwater recharge (PERC = GW_RCHG as time → ∞).
17	GW_RCHG	Recharge entering aquifers during time step (total amount of water entering shallow and deep aquifers during time step) (mm H2O).
18	DA_RCHG	Deep aquifer recharge (mm H2O). The amount of water from the root zone that recharges the deep aquifer during the time step. (shallow aquifer recharge = GW_RCHG - DA_RCHG)
19	REVAP	Water in the shallow aquifer returning to the root zone in response to a moisture deficit during the time step (mm H2O). The variable also includes water uptake directly from the shallow aquifer by deep tree and shrub roots.
20	SA_IRR	Irrigation from shallow aquifer (mm H2O). Amount of water removed from the shallow aquifer for irrigation during the time step.
21	DA_IRR	Irrigation from deep aquifer (mm H2O). Amount of water removed from the deep aquifer for irrigation during the time step.
22	SA_ST	Shallow aquifer storage (mm H2O). Amount of water in the shallow aquifer at the end of the time period.
23	DA_ST	Deep aquifer storage (mm H2O). Amount of water in the deep aquifer at the end of the time period.
24	SURQ_GEN	Surface runoff generated in HRU during time step (mm H2O).
25	SURQ_CNT	Surface runoff contribution to streamflow in the main channel during time step (mm H2O).
26	TLOSS	Transmission losses (mm H2O). Water lost from tributary channels in the HRU via transmission through the bed. This water becomes recharge for the shallow aquifer during the time step. Net surface runoff contribution to the main channel streamflow is calculated by subtracting TLOSS from SURQ.
27	LATQ	Lateral flow contribution to streamflow (mm H2O). Water flowing laterally within the soil profile that enters the main channel during time step.
28	GW_Q	Groundwater contribution to streamflow (mm H2O). Water from the shallow aquifer that enters the main channel during the time step. Groundwater flow is also referred to as baseflow.
29	WYLD	Water yield (mm H2O). Total amount of water leaving the HRU and entering main channel during the time step. (WYLD = SURQ + LATQ + GWQ – TLOSS – pond abstractions)
30	DAILYCN	Average curve number for time period. The curve number adjusted for soil moisture content.
31	TMP_AV	Average daily air temperature (°C). Average of mean daily air temperature for time period.
32	TMP_MX	Average maximum air temperature (°C). Average of maximum daily air temperatures for time period.
33	TMP_MN	Average minimum air temperature (°C). Average of minimum daily air temperatures for time period.
34	SOL_TMP	Soil temperature (°C). Average soil temperature of first soil layer for time period.
35	SOLAR	Average daily solar radiation (MJ/m2). Average of daily solar radiation values for time period.
36	SYLD	Sediment yield (metric tons/ha). Sediment from the HRU that is transported into the main channel during the time step.
37	USLE	Soil loss during the time step calculated with the USLE equation (metric

S.NO.	VARIABLE	DEFINITION
		tons/ha). This value is reported for comparison purposes only.
38	N_APP	Nitrogen fertilizer applied (kg N/ha). Total amount of nitrogen (mineral and organic) applied in regular fertilizer operations during the time step.
39	P_APP	Phosphorus fertilizer applied (kg P/ha). Total amount of phosphorus (mineral and organic) applied in regular fertilizer operations during the time step.
40	NAUTO	Nitrogen fertilizer auto-applied (kg N/ha). Total amount of nitrogen (mineral and organic) auto-applied during the time step.
41	PAUTO	Phosphorus fertilizer auto-applied (kg P/ha). Total amount of phosphorus (mineral and organic) auto-applied during the time step.
42	NGRZ	Nitrogen applied during grazing operation (kg N/ha). Total amount of nitrogen (mineral and organic) added to soil by grazing operation during the time step.
43	PGRZ	Phosphorus applied during grazing operation (kg P/ha). Total amount of phosphorus (mineral and organic) added to soil by grazing operation during the time step.
44	CFERTN	Nitrogen applied during continuous fertilizer operation (kg N/ha). Total amount of nitrogen (mineral and organic) added to soil by continuous fertilizer operation during time step.
45	CFERTP	Phosphorus applied during continuous fertilizer operation (kg P/ha). Total amount of phosphorus (mineral and organic) added to soil by continuous fertilizer operation during time step.
46	NRAIN	Nitrate added to soil profile by rain (kg N/ha).
47	NFIX	Nitrogen fixation (kg N/ha). Amount of nitrogen fixed by legumes during the time step.
48	F-MN	Fresh organic to mineral N (kg N/ha). Mineralization of nitrogen from the fresh residue pool to the nitrate (80%) pool and active organic nitrogen (20%) pool during the time step. A positive value denotes a net gain in the nitrate and active organic pools from the fresh organic pool while a negative value denotes a net gain in the fresh organic pool from the nitrate and active organic pools.
49	A-MN	Active organic to mineral N (kg N/ha). Movement of nitrogen from the active organic pool to the nitrate pool during the time step.
50	A-SN	Active organic to stable organic N (kg N/ha). Movement of nitrogen from the active organic pool to the stable organic pool during the time step.
51	F-MP	Fresh organic to mineral P (kg P/ha). Mineralization of phosphorus from the fresh residue pool to the labile (80%) pool (P in solution) and the active organic (20%) pool. A positive value denotes a net gain in solution and active organic pools from the fresh organic pool while a negative value denotes a net gain in the fresh organic pool from the labile and active organic pools.
52	AO-LP	Organic to labile mineral P (kg P/ha). Movement of phosphorus between the organic pool and the labile mineral pool during the time step. A positive value denotes a net gain in the labile pool from the organic pool while a negative value denotes a net gain in the organic pool from the labile pool.
53	L-AP	Labile to active mineral P (kg P/ha). Movement or transformation of phosphorus between the "labile" mineral pool (P in solution) and the "active" mineral pool (P sorbed to the surface of soil particles) during the time step. A positive value denotes a net gain in the active pool from the labile pool while a negative value denotes a net gain in the labile pool from the active pool.
54	A-SP	Active to stable P (kg P/ha). Movement or transformation of phosphorus between the "active" mineral pool (P sorbed to the surface of soil particles) and the "stable" mineral pool (P fixed in soil) during the time step. A positive value denotes a net gain in the stable pool from the active pool while a negative value denotes a net gain in the active pool from the stable pool.
55	DNIT	Denitrification (kg N/ha). Transformation of nitrate to gaseous compounds during the time step.
56	NUP	Plant uptake of nitrogen (kg N/ha). Nitrogen removed from soil by plants during the time step.
57	PUP	Plant uptake of phosphorus (kg P/ha). Phosphorus removed from soil by plants during the time step.
58	ORGN	Organic N yield (kg N/ha). Organic nitrogen transported out of the HRU and into the reach during the time step.
59	ORGP	Organic P yield (kg P/ha). Organic phosphorus transported with sediment into the reach during the time step.
60	SEDP	Sediment P yield (kg P/ha). Mineral phosphorus sorbed to sediment transported into the reach during the time step.
61	NSURQ	NO3 in surface runoff (kg N/ha). Nitrate transported with surface runoff into the reach during the time step.
62	NLATQ	NO3 in lateral flow (kg N/ha). Nitrate transported by lateral flow into the reach during the time step.
63	NO3L	NO3 leached from the soil profile (kg N/ha). Nitrate that leaches past the

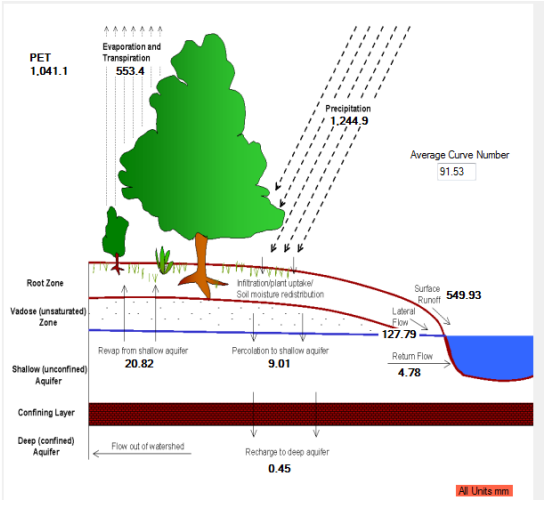
S.NO.	VARIABLE	DEFINITION
		bottom of the soil profile during the time step. The nitrate is not tracked through the shallow aquifer.
64	NO3GW	NO3 transported into main channel in the groundwater loading from the HRU (kg N/ha).
65	SOLP	Soluble P yield (kg P/ha). Soluble mineral forms of phosphorus transported by surface runoff into the reach during the time step.
66	P_GW	Soluble phosphorus transported by groundwater flow into main channel during the time step (kg P/ha).
67	W_STRS	Water stress days during the time step (days).
68	TMP_STRS	Temperature stress days during the time step (days).
69	N_STRS	Nitrogen stress days during the time step (days).
70	P_STRS	Phosphorus stress days during the time step (days).
71	BIOM	Biomass (metric tons/ha). Total biomass, i.e. aboveground and roots at the end of the time period reported as dry weight.
72	LAI	Leaf area index at the end of the time period.
73	YLD	Harvested yield (metric tons/ha). The model partitions yield from the total biomass on a daily basis (and reports it). However, the actual yield is not known until it is harvested. The harvested yield is reported as dry weight.
74	BACTP	Number of persistent bacteria in surface runoff entering reach (# cfu/100 mL).
75	BACTLP	Number of less persistent bacteria in surface runoff entering reach (#cfu/100 mL).
76	WATB_CLI	Water table from above the soil profile (mm) (daily output only; not used in tile flow equations)
77	WATB_SOL	Water table depth from the bottom of the soil surface (mm) (daily output only; not used in tile flow equations)
78	SNO	Snow water content (mm)
79	CMUP	Current soil carbon for first soil layer (kg/ha).
80	CMTOT	Current soil carbon integrated for all soil layers (kg/ha)
81	QTILE	Drain tile flow in soil profile for the day (mm)
82	TNO3	Amount of NO3-N in tile flow in HRU (kg N/ha).
83	LN03	Amount of NO3-N in lateral flow in HRU (kg N/ha).

Results of all the parameters available on different drainage outlet points of each microwatershed have been analysed. The area of Beas River Basin falling in district Kangra is divided into total 649 micro-watersheds with the average area of 10 km^2. The blockwise watershed maps and hydrological modelling results of drainage outlet points at each all fifteen blocks are depicted as follows:



Map 8.10 Hydrological Map

As depicted above SWAT model outputs with respect to hydrology of the Beas River Basin falling in Kangra district on relevant perimeters are further used as input for climate change vulnerability assessment to represent Exposure & Sensitivity indicators/ variables. The indicators used in climate change vulnerability assessment are watershed level temperature values, precipitation values, water yield, water stress, temperature stress, slopes etc.



9

Climate Change Vulnerability Assessment Analysis: District Kangra

9 Climate Change Vulnerability Assessment Analysis: District Kangra

The process and methodology used in this study has been sub-divided into four phases for adopting a conceptual framework of vulnerability, generating spatial datasets of key factors, estimating the weights of various factors contributing to vulnerability and generating the vulnerability ranking maps of the districts in the study area. The novelty of this study is that it has considered climatic, physical and socio-economic factors together to arrive at the vulnerability rating. The methodology of vulnerability assessment is based on the integration of various climatic, environmental and socio-economic factors following the multi-criteria decision-making technique in a geographical information system (GIS). Various steps of methodology include (1) identification of indicators, (2) ranking of indicators, and (3) calculation of vulnerability index.

9.1 Identification of Indicators

Construction of vulnerability index consists of several steps. First is the selection of study area, which consists of several regions. In our case fifteen-development block of district Kangra falling in Beas River Bain were indicated. In each region a set of indicators have been selected for each of the three component of vulnerability i.e. Exposure, Sensitivity, Adaptive Capacity. The indicators have been selected based on the availability of data, personal judgment or previous research. Since vulnerability is dynamic over time, it is important that all the indicators relate to the particular year chosen. An attempt has been made to assess vulnerability assessment over the years, depending upon the availability of data for each year for all the indicators of each block. A list of indicators shown as under, it can be modified according to the availability of data and need in future as well, the process is dynamic and can be further expended based on data and time.

A brief description of these indicators along with their data source are given as under:

Description of variables/indicators used for vulnerability assessment

Code	Exposure	Units	Years	Functional Relationship with Exposure	Data Source
E01	Average maximum temperature	°C	1979-2013	↑	SWAT Model
E02	Average minimum temperature	°C	1979-2013	↑	SWAT Model
E03	Total amount of precipitation	mm	1979-2013	↓	SWAT Model
E04	Water stress days	Days	1979-2013	↑	SWAT Model
E05	Temperature stress days	Days	1979-2013	↑	SWAT Model
Code	**Sensitivity**	**Units**	**Years**	**Functional Relationship with Sensitivity**	**Data Source**
S01	Average Hill Slope	Degree	-	↑	SWAT Model
S02	Annual Average Water Yield	mm	1979-2013	↓	SWAT Model
S03	Percentage of Net Sown Area to Geographical area	%age	2011	↑	Census 2011
S04	Human population density	Person/Ha.	2011	↑	Census 2011
S05	Percentage of Un-irrigated Land Area to Geographical area	%age	2011	↑	Census 2011
S06	Percentage of Barren & Un-cultivable Land Area to Geographical area	%age	2011	↑	Census 2011
S07	Percentage of Cultivable Waste Land Area to Geographical Area	%age	2011	↑	Census 2011

Code	Adaptive Capacity	Units	Years	Functional Relationship with Adaptive Capacity	Data Source
A01	Educational Institutes	Number	2011	↑	Census 2011
A02	Health Institutes	Number	2011	↑	Census 2011
A03	Road Network	Yes/No	2011	↑	Census 2011
A04	Agricultural Credit Societies	Yes/No	2011	↑	Census 2011
A05	Self Help Group	Yes/No	2011	↑	Census 2011
A06	Mandis/Regular Market	Yes/No	2011	↑	Census 2011

A11	Irrigated Area	Hectares	2011	↑	Census 2011

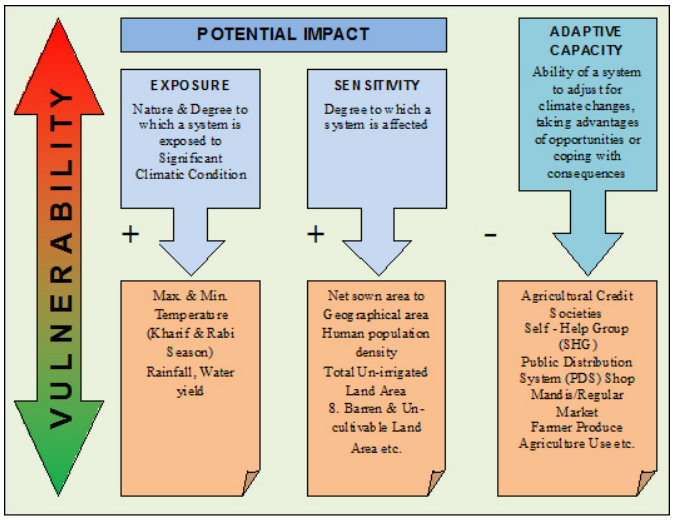

Figure 9.1 Frameworks for Calculation of Vulnerability

9.2 Exposure

The effects of climate change are different at different locations. Some regions are warmer than the others. Also, the precipitation patterns shift in different areas are varying resulting in uneven distribution of rainfall. Some regions observes prolonged dry periods and some experience both warm and intense rainfall. In correlations with the above statements reveals that exposure relates to the degree of climate stress at a particular location. The exposure can also be determined by the long-term climatic changes or the variation in climate including the magnitude and frequency of hazards.

The major constraints in studying and analysing the climate change is un-availability of long-term observed data at desired locations. The Global Climate Modelling (GCM) could act as solution to this problem, but it could provide climate information on a very broader scale, which sometime might not match or desirable/ fit to the local conditions. Local climate change is influenced significantly by local topographical features, such as mountains. GCMs are not able to account for these local topographies as they use a relatively coarse spatial resolution. On the other hand Regional Climate Models (RCM) have a comparatively higher resolution (approximately 25 km) and are influenced by a smaller scale of topographical features. It is much more computationally intensive to run an RCM. Therefore, in our case we have adopted/ used RCM technique to generate local climate data.

The Regional Climate Modelling technique consists of using initial conditions, time-dependent lateral meteorological conditions and surface boundary conditions to drive high-resolution RCMs. The driving data is derived from GCMs (or analyses of observations) and can include GHG and aerosol forcing. A variation of this technique is to also force the large-scale component of the RCM solution throughout the entire domain *(e.g., Kida et al., 1991; Cocke and LaRow, 2000; von Storch et al., 2000)*

The provision of a flexible RCM is part of an integrated package of methods, which would also include a range of GCM projections for assisting countries to generate climate change scenarios and hence to inform adaptation decisions. The Hadley Centre has developed such a flexible RCM a practical tool to make their own projections of national patterns of climate change and hence estimate the possible impacts and assess their vulnerability. It must be stressed that the RCM does not replace GCMs, but it is a powerful tool to be used together with the GCMs in order to add fine scale detail to their broad-scale projections.

Before inception of the climate change vulnerability assessment report, PRECIS (Providing Regional Climates for Impacts Studies) was proposed for generating regional climate data, but due to its requirement of long time for complex operating procedures and non-availability of desired inputs some other regional climate models and methods were used for analysing climate data.

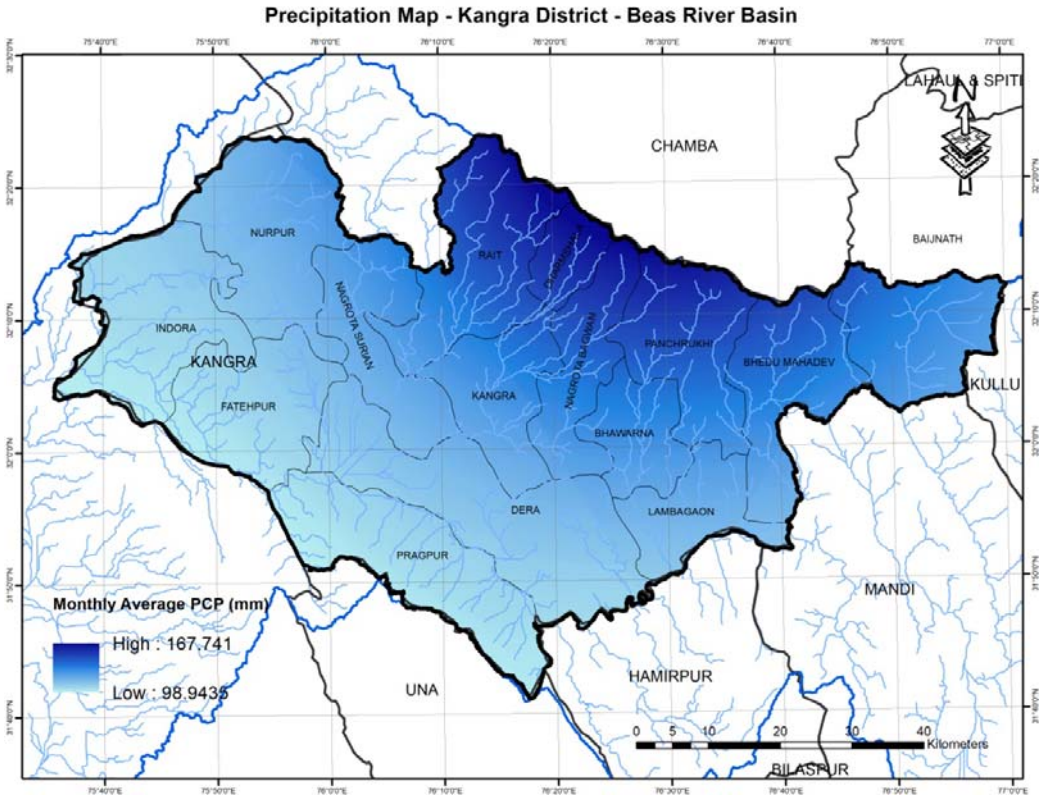
Modelling & Climate Change Projections

Two scenario RCP 4.5 & RCP 8.5 are used for climate projections. Representative Concentration Pathway (RCP) 4.5 is a scenario that stabilizes radiative forcing at 4.5 W m−2 in the year 2100 without ever exceeding that value. Simulated with the Global Change Assessment Model (GCAM), RCP4.5 includes longterm, global emissions of greenhouse gases, short-lived species, and land-use-land-cover in a global economic framework. RCP4.5 was updated from earlier GCAM scenarios to incorporate historical emissions and land cover information common to the RCP process and follows a cost-minimizing pathway to reach the target radiative forcing. The imperative to limit emissions in order to reach this target drives changes in the energy system, including shifts to electricity, to lower emissions energy technologies and to the deployment of carbon capture and geologic storage technology. In addition, the RCP4.5 emissions price also applies to land use emissions; as a result, forest lands expand from their present day extent. The simulated future emissions and land use were downscaled from the regional simulation to a grid to facilitate transfer to climate models. While there are many alternative pathways to achieve a radiative forcing level of 4.5 W m−2, the application of the RCP4.5 provides a common platform for climate models to explore the climate system response to stabilizing the anthropogenic components of radiative forcing.

The RCP8.5 combines assumptions about high population and relatively slow income growth with modest rates of technological change and energy intensity improvements, leading in the long term to high energy demand and GHG emissions in absence of climate change policies. Compared to the total set of Representative Concentration Pathways (RCPs), RCP8.5 thus corresponds to the pathway with the highest greenhouse gas emissions. Using the IIASA Integrated Assessment Framework and the MESSAGE model for the development of the RCP8.5, we focus in this paper on two important extensions compared to earlier scenarios: 1) the development of spatially explicit air pollution projections, and 2) enhancements in the land-use and land-cover change projections. In addition, we explore scenario variants that use RCP8.5 as a baseline, and assume different degrees of greenhouse gas mitigation policies to reduce radiative forcing. Based on our modeling framework, we find it technically possible to limit forcing from RCP8.5 to lower levels comparable to the other RCPs (2.6 to 6 W/m2). Our scenario analysis further indicates that climate policyinduced changes of global energy supply and demand may lead to significant co-benefits for other policy priorities, such as local air pollution.

9.2.1 Precipitation & Temperature

In order to analyse climate change global weather data available for 30 years (1979-2013) was analysed but since the scale of our study is panchayat/village level the precipitation was available for the few locations as depicted in Weather Station Location Map (Map 8.4).



Map 9.1 Monthly Average Precipitation Map– Kangra District

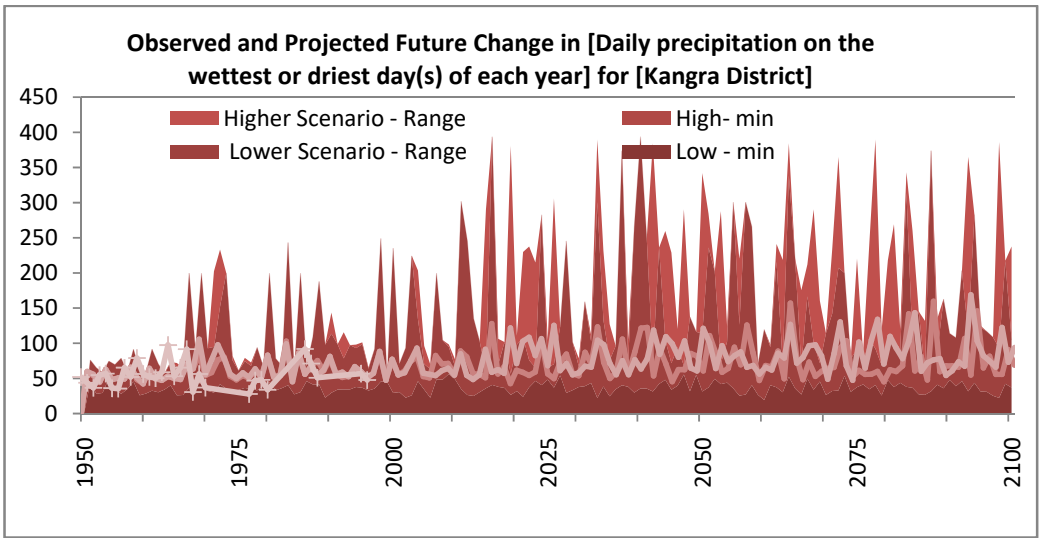


Figure 9.2 Frameworks for Calculation of Vulnerability

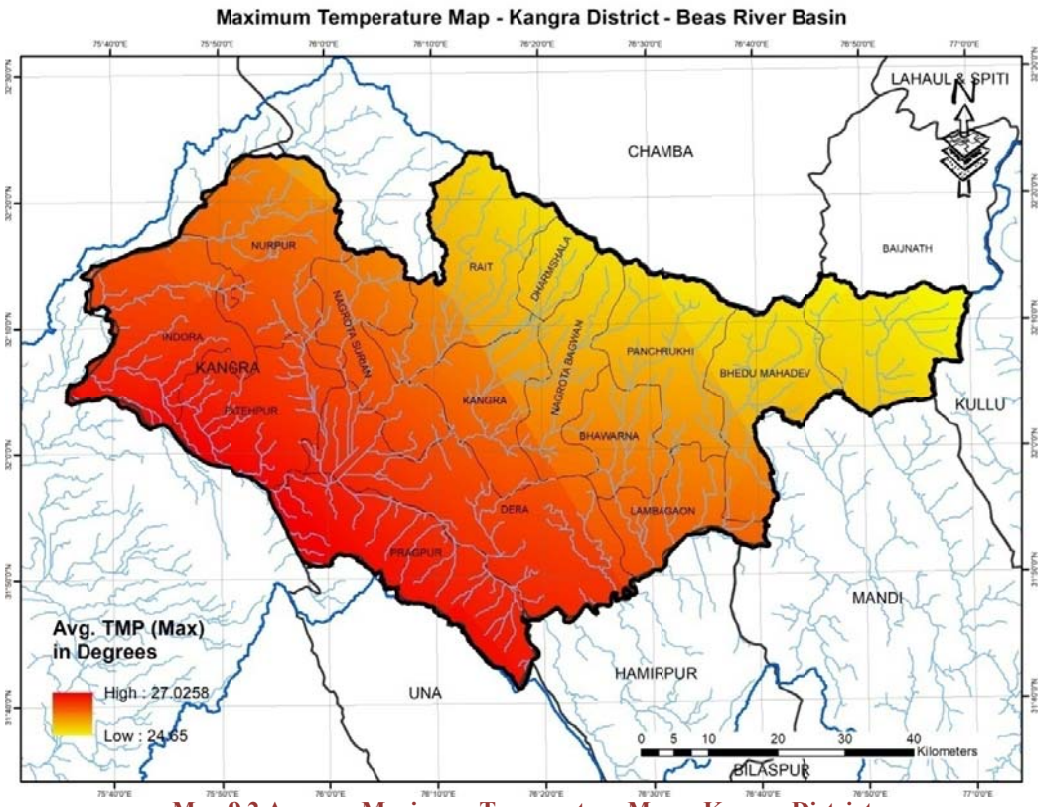
Since precipitation is one of the indicator used in analysing climate change vulnerability at village level, there is a requirement of precipitation values for each village, therefore, the available data is further extrapolated using IWD method (*Inverse Distance Weighting is a type of deterministic method for multivariate interpolation with a known scattered set of points. The assigned values to unknown points are calculated with a weighted average of the values available at the known points*).



Map 9.2 Average Maximum Temperature Map – Kangra District

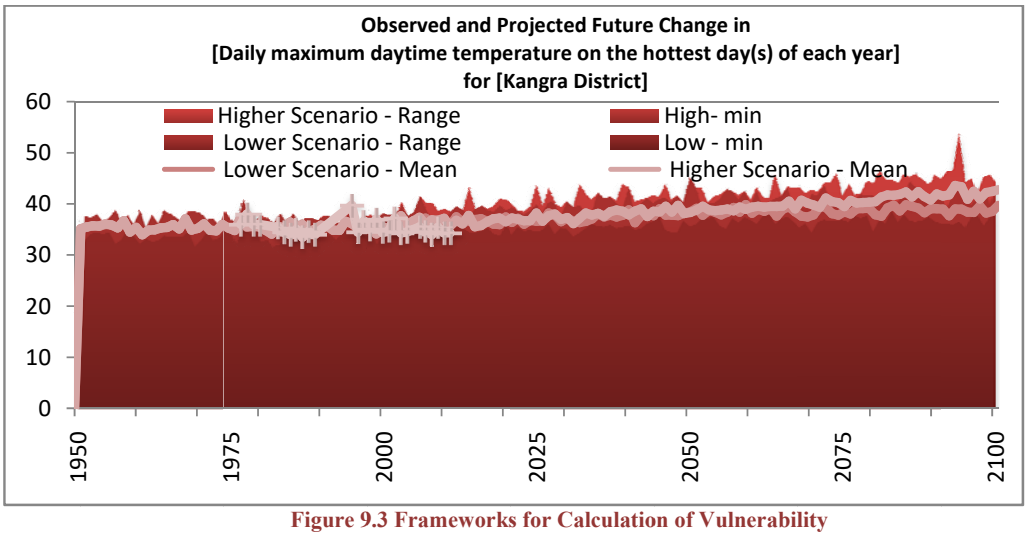


Figure 9.3 Frameworks for Calculation of Vulnerability

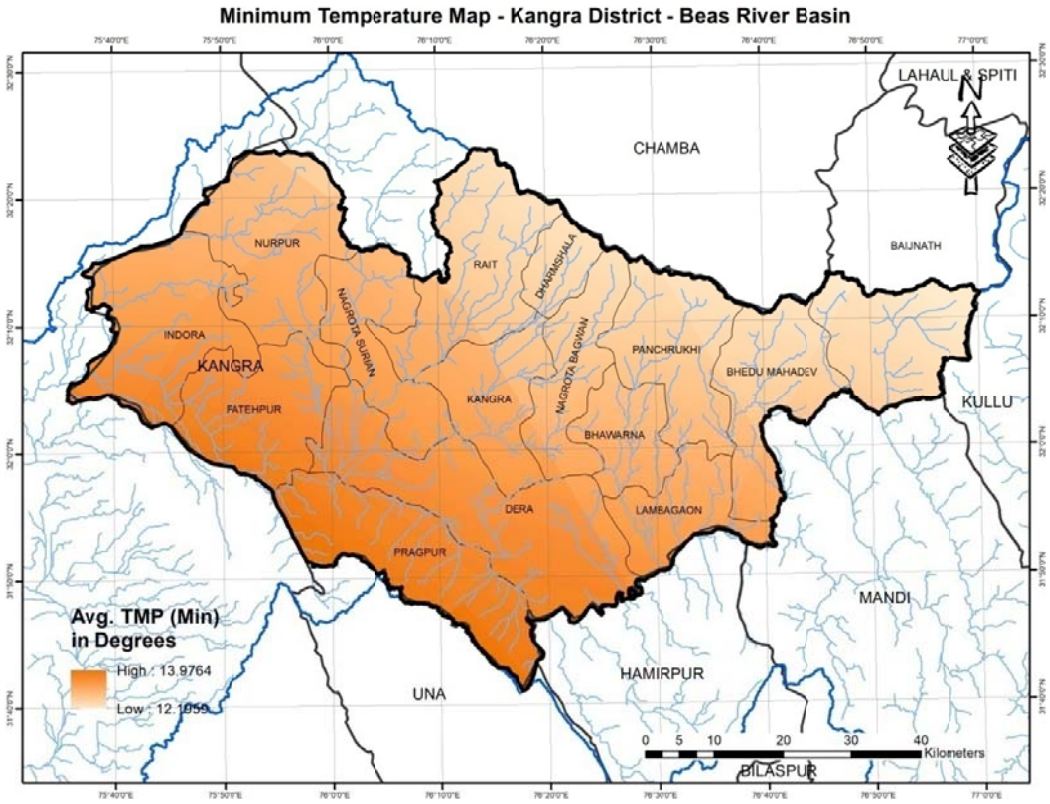

Map 9.3 Average Minimum Temperature Map – Kangra District

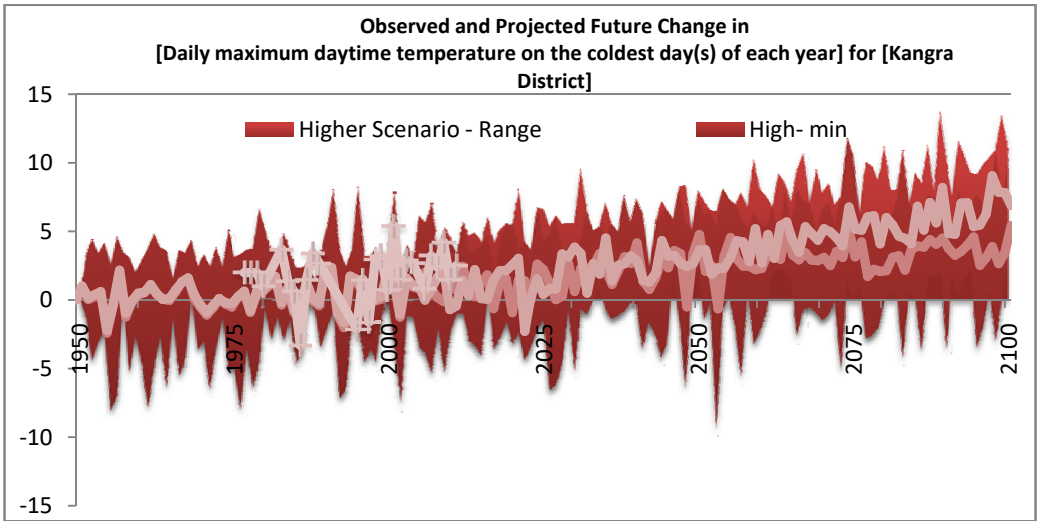

Figure 9.4 Frameworks for Calculation of Vulnerability

After downscaling the global climate data to the regional level the clear picture of climate change appeared. With observed and future climate change projections w.r.t. Precipitation wettest & driest day, Maximum & Minimum day temperature on the hottest days(s) of each year (Year 1950-2100) analysed and depicted through graphs. Analysis reveals increase in minimum & maximum day temperature on the hottest day(s) over 150 years from today onwards.

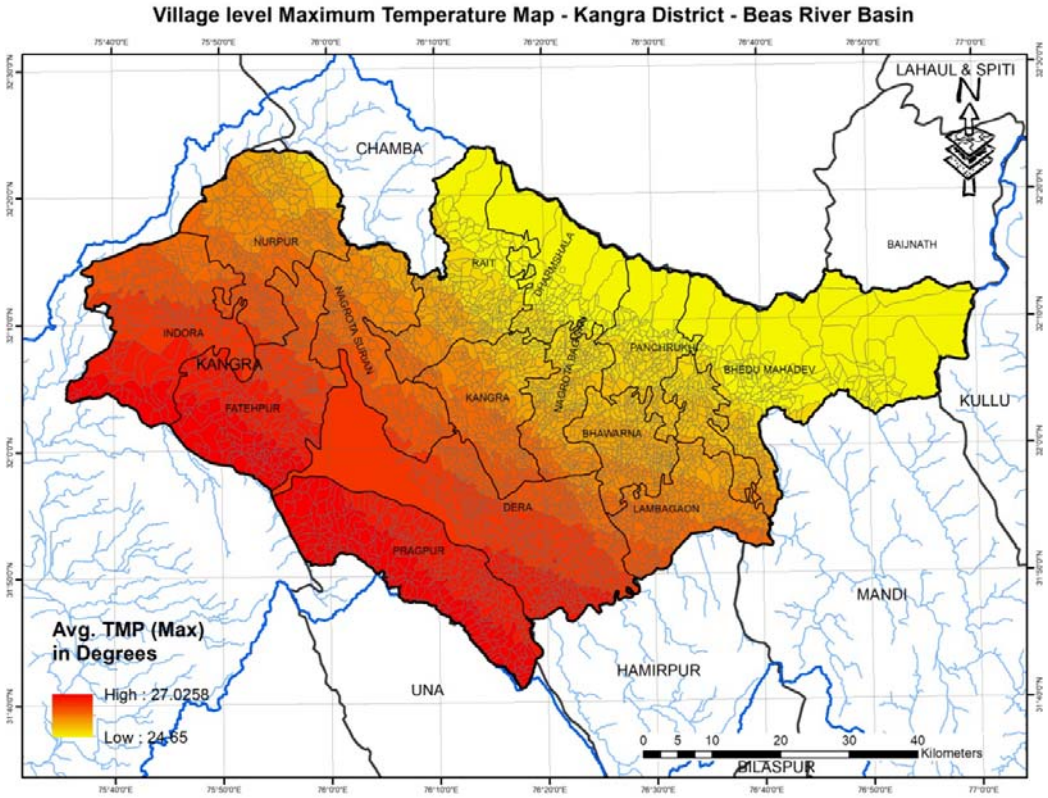
9.3 Exposure Indicators

Five indicators of exposure have been analysed and computed using meteorological data for a period of 34 years (1979-2013). The maps have been developed for each of these indicators of climatic exposure. The indicator-wise analysis is as under:

Code	Exposure	Units	Years	Functional Relationship with Exposure	Data Source
E01	Average maximum temperature	°C	1979-2013	↑	SWAT Model
E02	Average minimum temperature	°C	1979-2013	↑	SWAT Model
E03	Average precipitation	mm	1979-2013	↓	SWAT Model
E04	Water stress days	Days	1979-2013	↑	SWAT Model
E05	Temperature stress days	Days	1979-2013	↑	SWAT Model

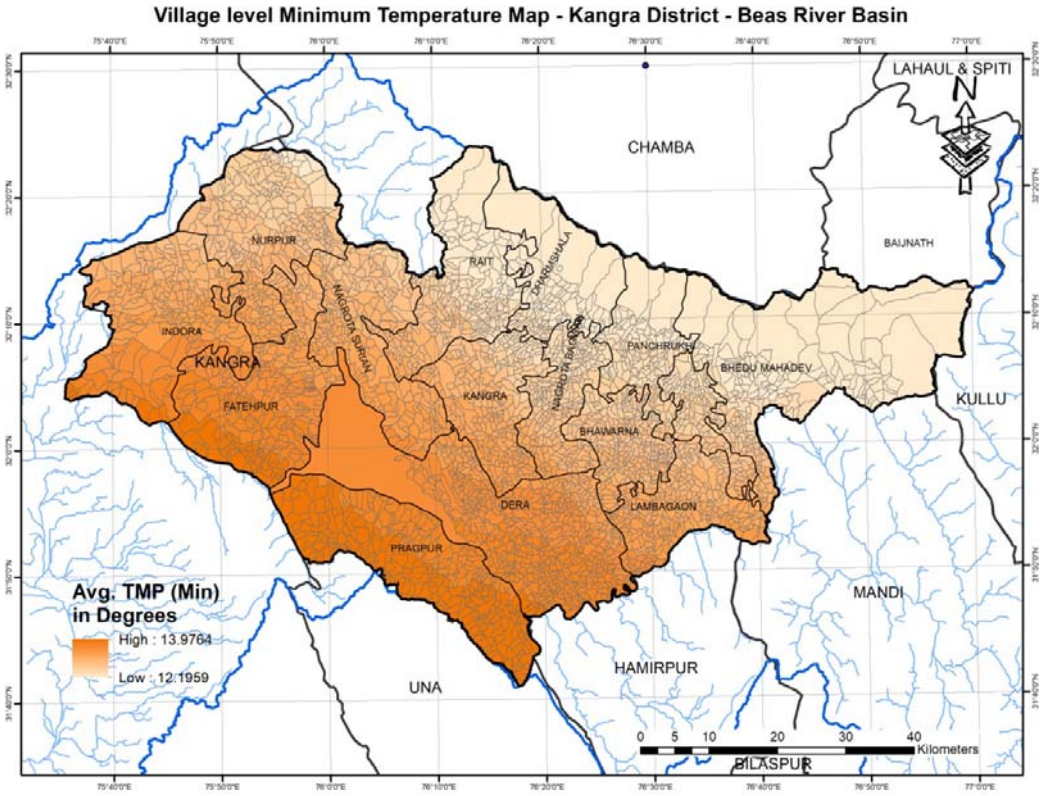
E01 Average maximum temperature

Global Weather data has been used to calculate temperature indicator. There were only six weather stations covering only 6 blocks out of total 15 developmental blocks. The data for the period of 34 years (1979-2013) is available. Temperature data is available on daily basis. Aaverage has been calculated for 34 years.



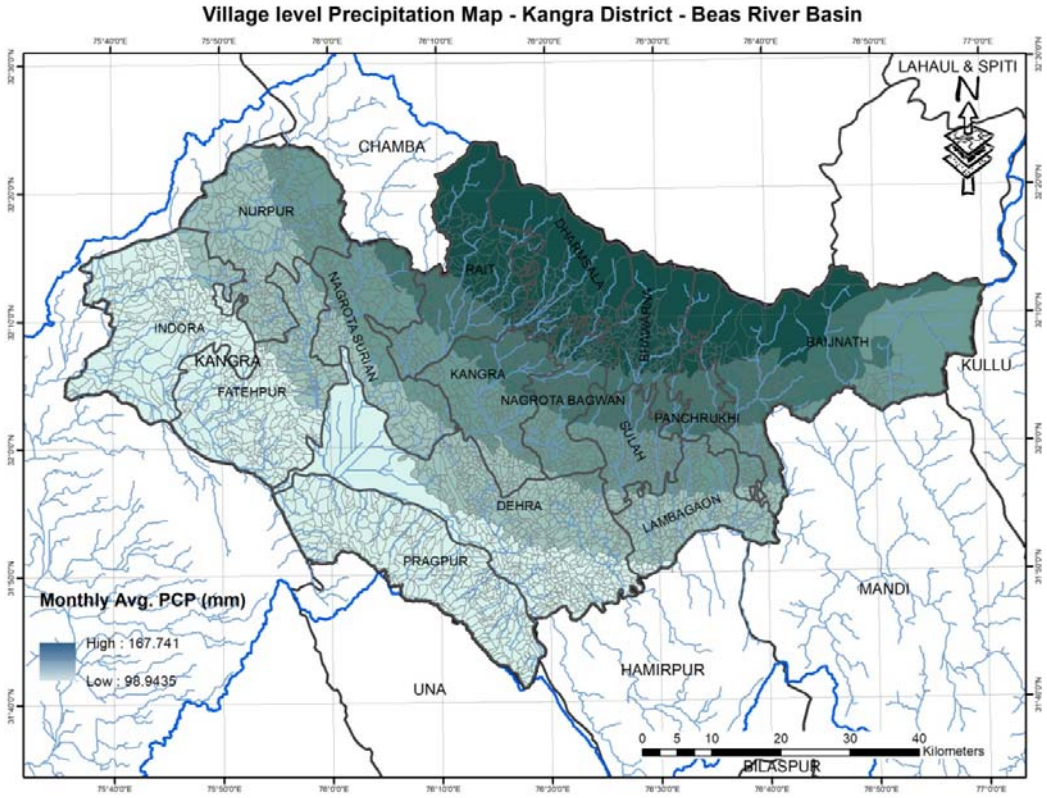
Map 9.4 Village level average maximum temperatures – Beas Basin - Kangra District

E02 Annual average minimum temperature



Map 9.5 Village level average minimum temperatures – Beas Basin - Kangra District

E03 Average precipitation

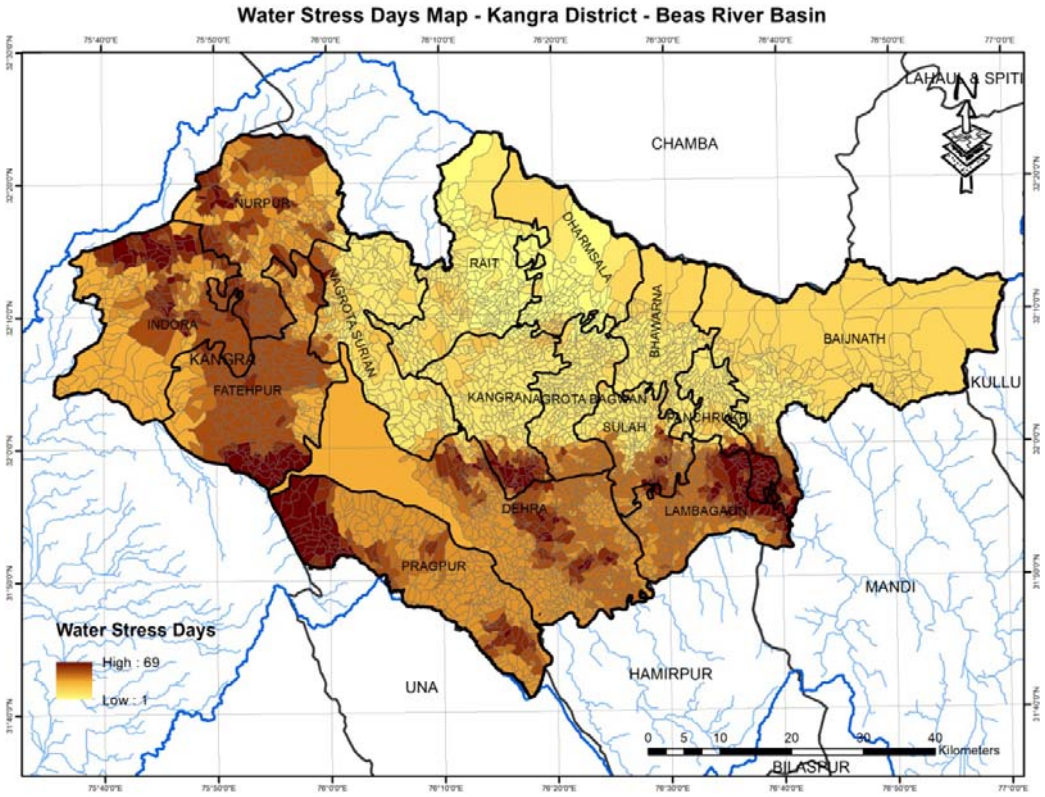


Map 9.6 Village level Monthly Average Precipitation – Beas Basin Kangra District

Global Weather data has been used to calculate precipitation indicator. As explained earlier, there were only 6 weather stations for 15 developmental blocks and data for the period of 34 years (1979-2013) is available. Precipitation data is available on daily basis. Monthly average has been calculated for 34 years.

E04 Water stress days

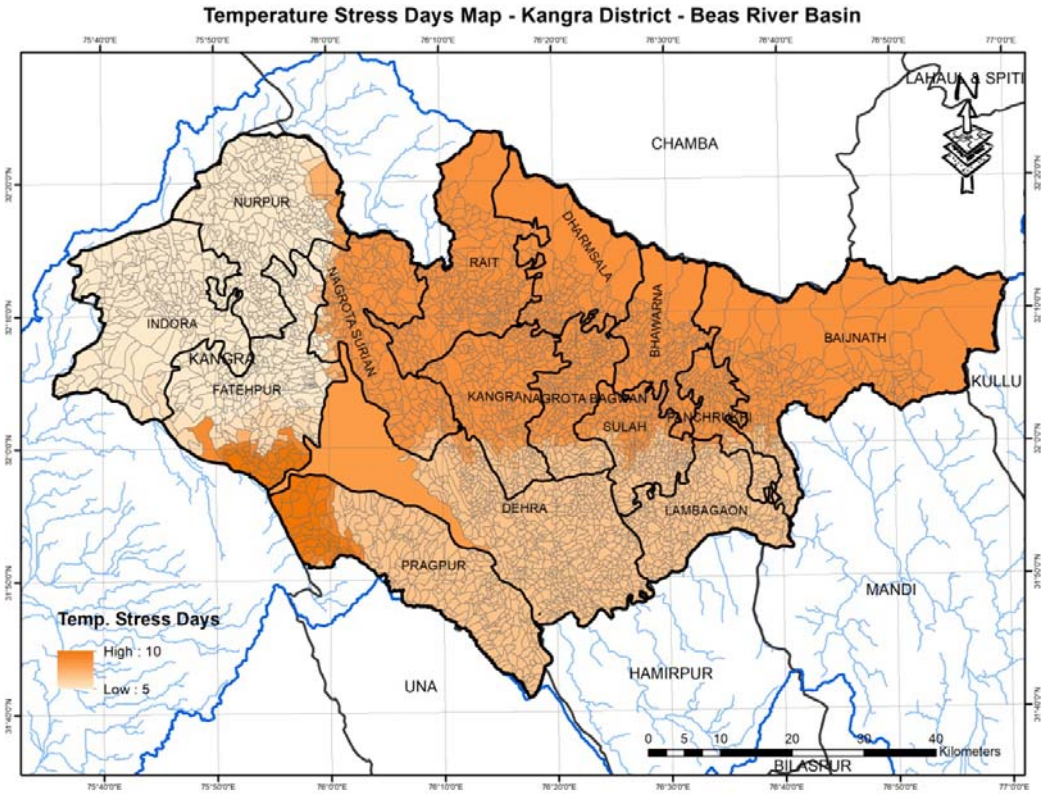
The water stress days are generated analysing results/data through SWAT model. Water stress days for each Hydrological Response Unit (HRU), the smallest unit of micro shed are generated after running the SWAT model. These water stress days are further calculated for all the villages of the 15 developmental blocks of district Kangra falling in Beas River Basin. The following Map 9.7 depicts that villages of Indora, Nurpur, Fatehpur, Dehra, Kangra, Pragpur, Lambagaon & Panchrukhi encounter more water stress days as compare to the other Blocks. More the water stress days will increase the exposure to the climate change vulnerability.



Map 9.7 Village wise Water Stress Days – Beas Basin - Kangra District

E05 Temperature stress days

The temperature stress days have also been generated after SWAT model analysis and shown in Map 9.8. Temperature stress days for each Hydrological Response Unit (HRU) the smallest unit of micro shed are generated. These temperature stress days are further calculated for all the villages of the 15 developmental blocks of district Kangra falling in Beas River Basin. The Map 9.8 depicts that villages of Nagrota Surian, Rait, Dharamshala, Bhawarana, Baijnath, Kangra, Nagrota Bagwan, Sulah, Panhrukhi, parts of Fatehpur & Pragpur Blocks encounter more temperature stress days as compare to the other Blocks. More temperature stress days will increase the exposure to the climate change vulnerability.



Map 9.8 Temperature Stress Days – Beas Basin Kangra District

9.4 Composite Exposure

Composite exposure has been calculated using normalization of values of five variables viz: rainfall, temperature (E01, E02, E03, E04 & E05). Since the values are with different scale and units, the normalization of indicators using functional relationship has been done.

Variable Indicator E01 i.e. Average maximum temperature has ↑ functional relationship with exposure and the normalization is done using the formula, which means the increase in average maximum temperature will increase the exposure level that will further leads to high vulnerability:

$$x_{ij} = \frac{X_{ij} - Min_i\{X_{ij}\}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

However, for indicator E03 i.e. Average precipitation the normalization is done using the formula:

$$y_{ij} = \frac{Max_i\{X_{ij}\} - X_{ij}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

This is because the function relationship of indicator E03 with vulnerability is ↓, which means, the increase in precipitation will reduce exposure level and vulnerability.

After calculating the score of variables E01, E02, E03, E04 & E05 the average score is calculated and the Composite Exposure has been calculated and mapped for all villages of 15 blocks of district Kangra falling in Beas River Basin.

Village/ Town Code	Village/ Town Name	Block	Indicators/ Variables					Composite Exposure
			E01	E02	E03	E04	E05

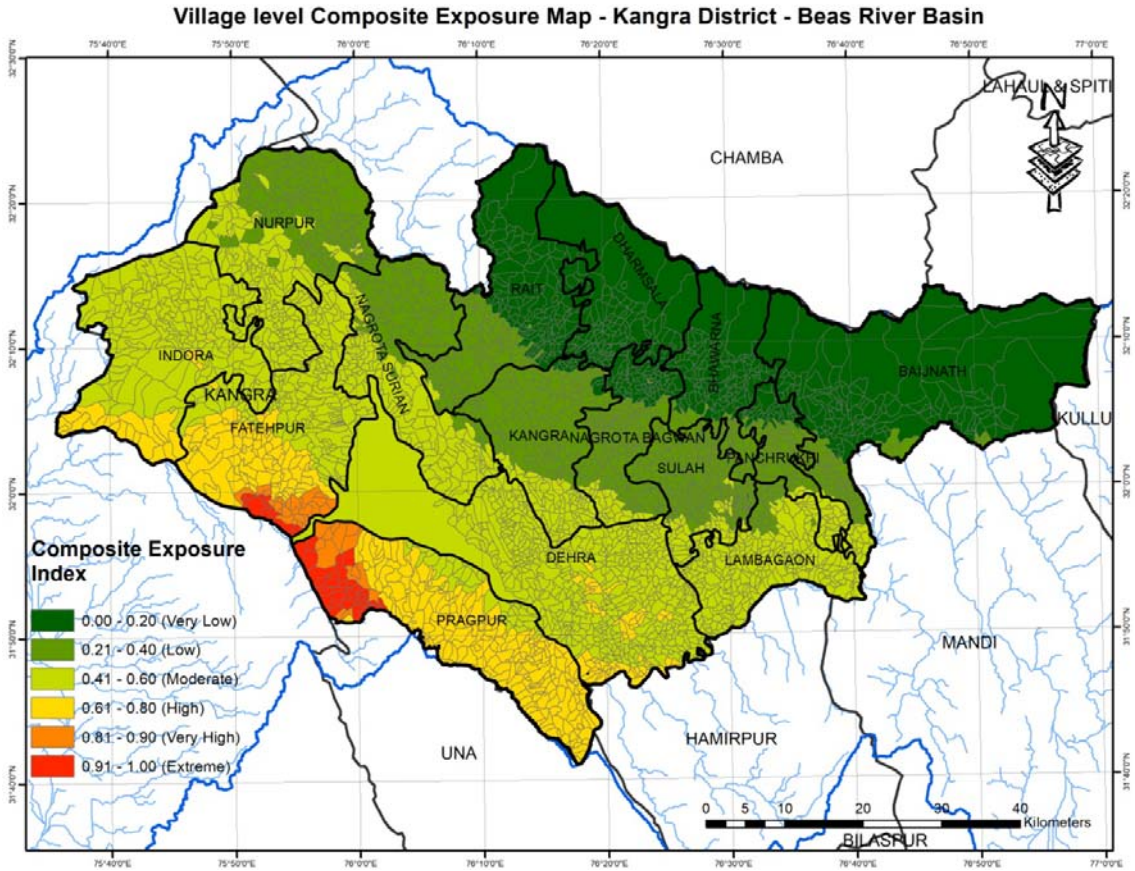


Map 9.9 Village level Composite Exposure Map – Beas Basin - Kangra District

The Composite Exposure Map (Map: 9.9) depicts that exposure level villages of Fagehpur & Pragpur is higher than the other Blocks. The village wise exposure level has been shown in the table.

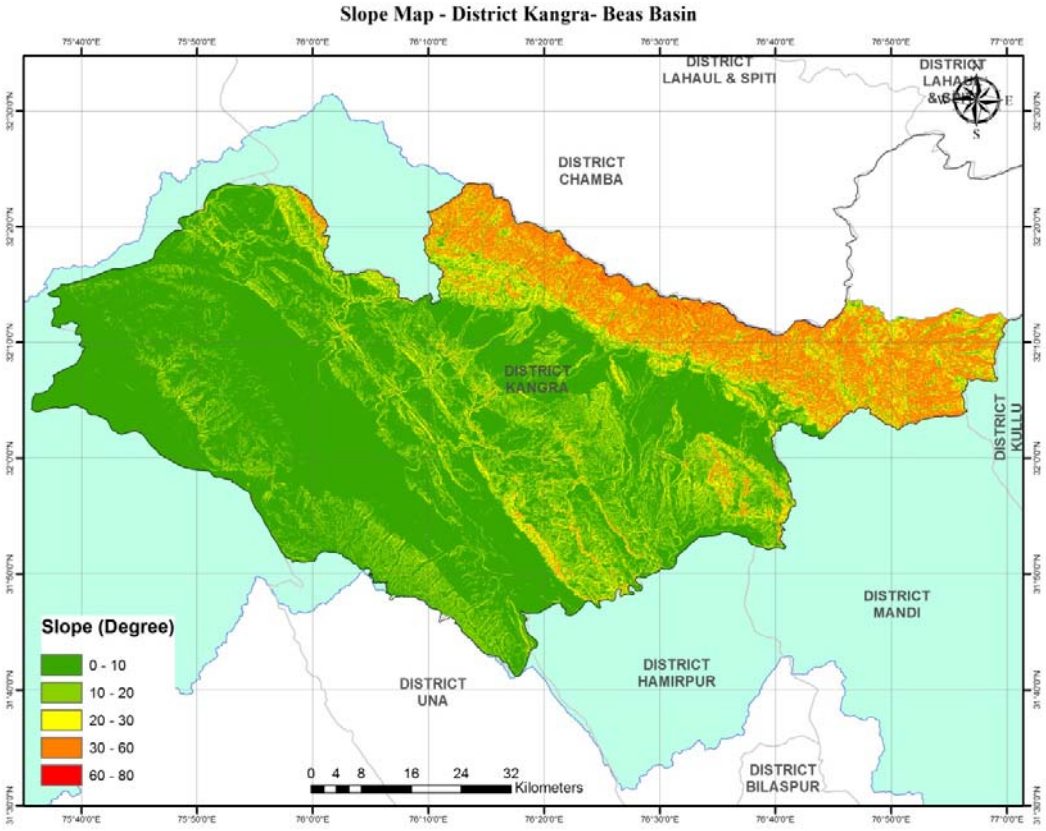
9.5 Sensitivity indicators

The relative importance of the effects of climate change varies with different regions, groups and sectors in society. For example, highly intense rainfall may lead to devastating results in some region, whereas the same may not be of much harm in some other region. The degree to which a system is modified or affected by internal, external, or sometimes with both disturbances is defined as sensitivity. The measure that reflects the responsiveness of a system to climatic influences determines the degree to which a group is affected by the environmental stress.

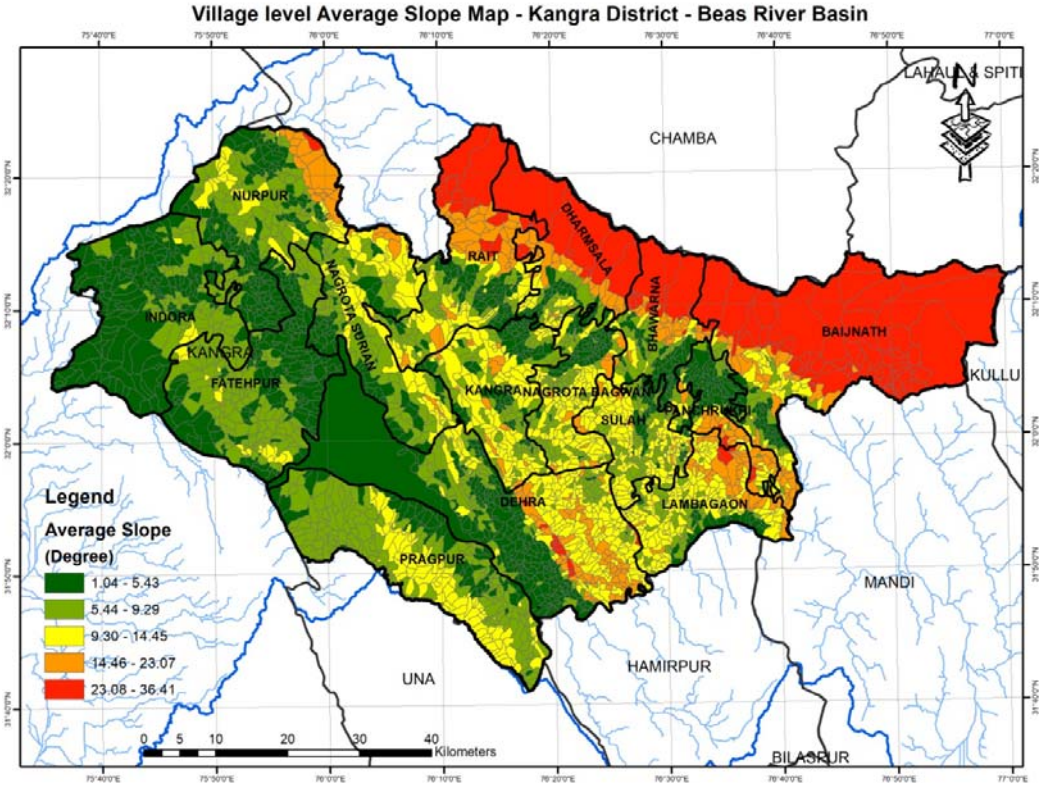
Hence in this analysis we have used eight indicators of sensitivity computation using values generated for Rate of Increase in Water Yield by SWAT model, Average Hill slope calculated using DEM, calculating Percentage of Net Sown area to the geographical area, Human population density per hectares, Percentage of Un-irrigated Land Area to Geographical area, Percentage of Barren & Un-cultivable Land Area to Geographical area, Percentage of Barren & Un-cultivable Land Area to Geographical area, Percentage of Forest Area to Geographical Area and Percentage of Cultivable Waste Land Area to Geographical Area. The maps have also been developed for each of these Sensitivity indicators. The indicator-wise functional relationship analysis is as follows:

Code	Sensitivity	Units	Years	Functional Relationship with Sensitivity	Data Source
S01	Average Hill Slope	Degree	-	↑	Generated from SWAT Model
S02	Annual Average Water Yield	mm	1979-2013	↓	Generated from SWAT Model
S03	Percentage of Net Sown Area to Geographical area	%age	2011	↑	Census 2011
S04	Human population density	Person/Ha.	2011	↑	Census 2011
S05	Percentage of Un-irrigated Land Area to Geographical area	%age	2011	↑	Census 2011
S06	Percentage of Barren & Un-cultivable Land Area to Geographical area	%age	2011	↑	Census 2011
S07	Percentage of Cultivable Waste Land Area to Geographical Area	%age	2011	↑	Census 2011

S01 Average Hill Slope

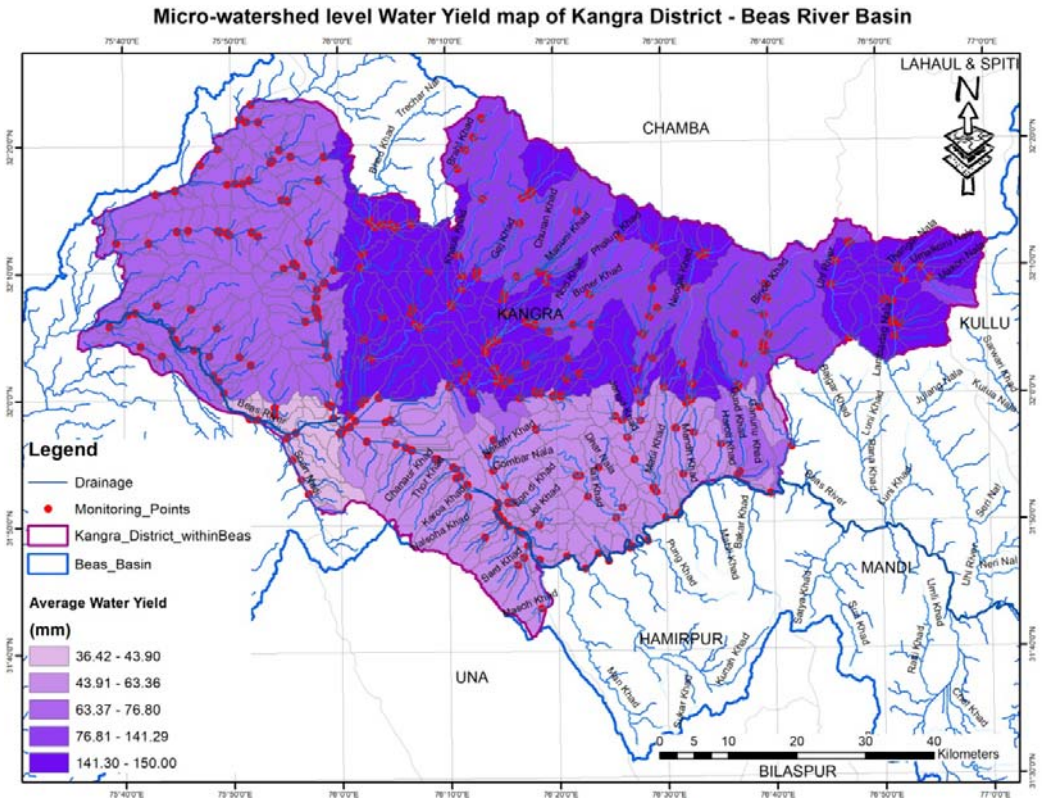


Map 9.10 (a) Slope Map of District Kangra

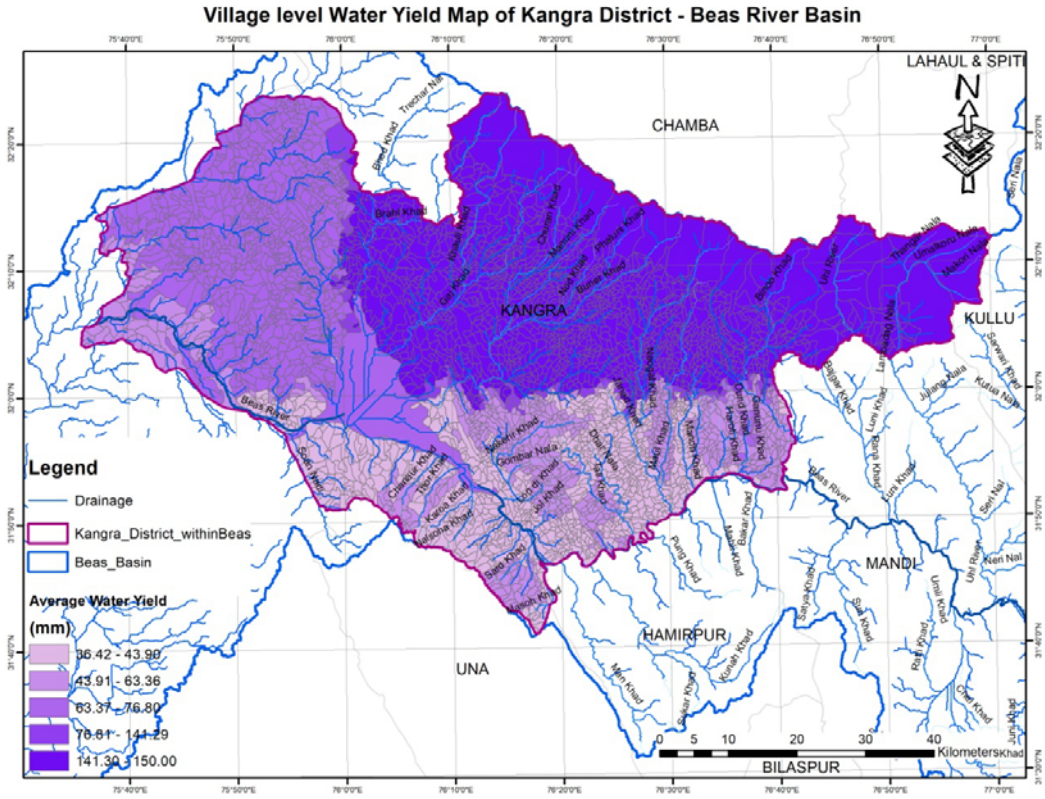


Map 9.10 (b) Villages level Average Slope

S02 Average Water Yield

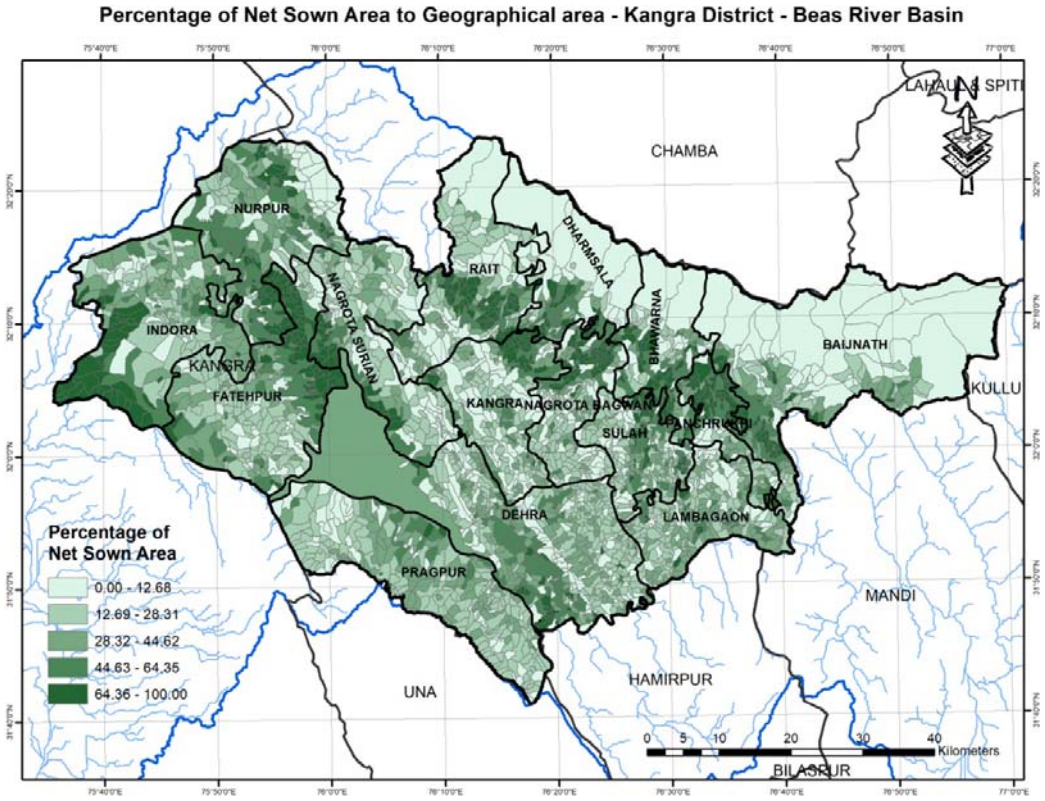


Map 9.11 (a) Micro-watershed level Average Water Yield (1979-2013)



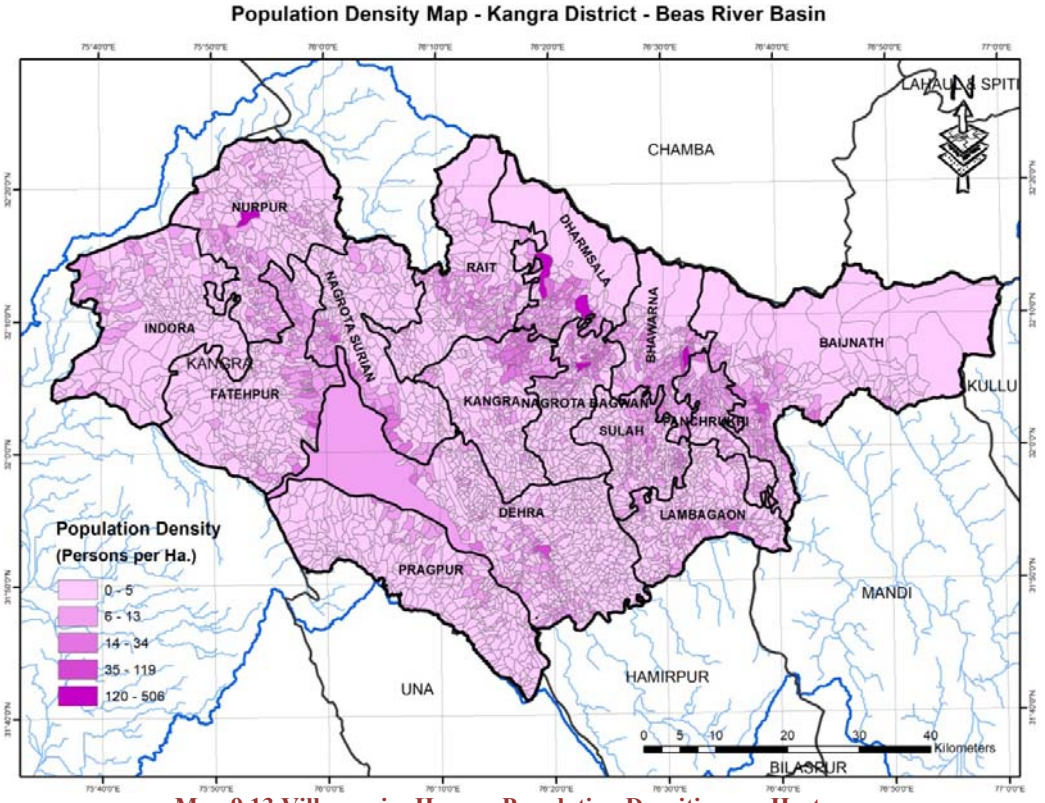
Map 9.11 (b) Village level Average Water Yield (1979-2013)

S03 Percentage of Net Sown Area to Geographical area



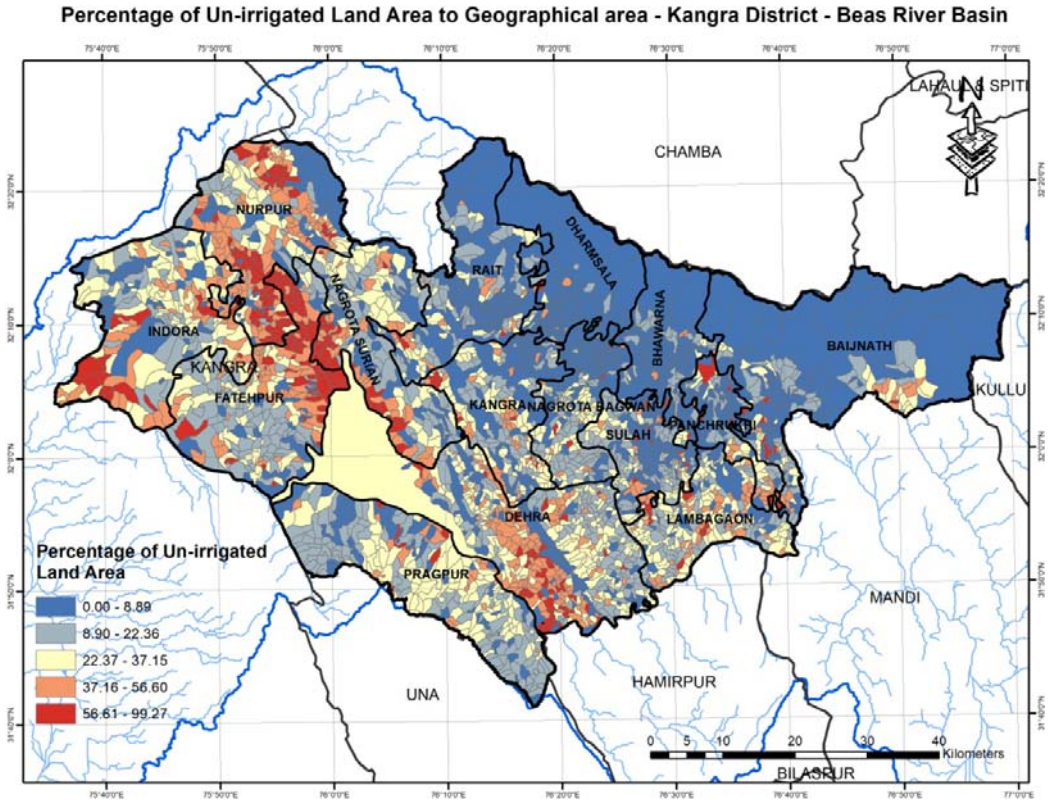
Map 9.12 Percentage of Net Sown Area to Geographical area

S04 Human Population Density



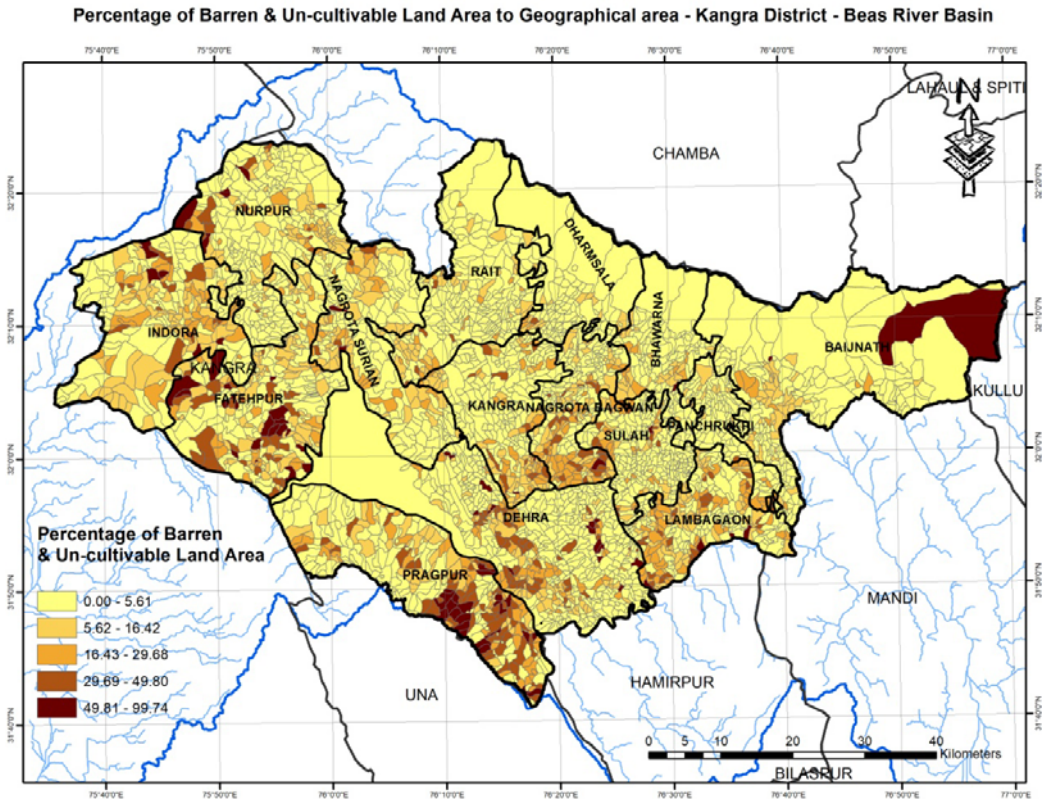
Map 9.13 Village wise Human Population Densities per Hectares

S05 Percentage of Un-irrigated Land Area to Geographical area



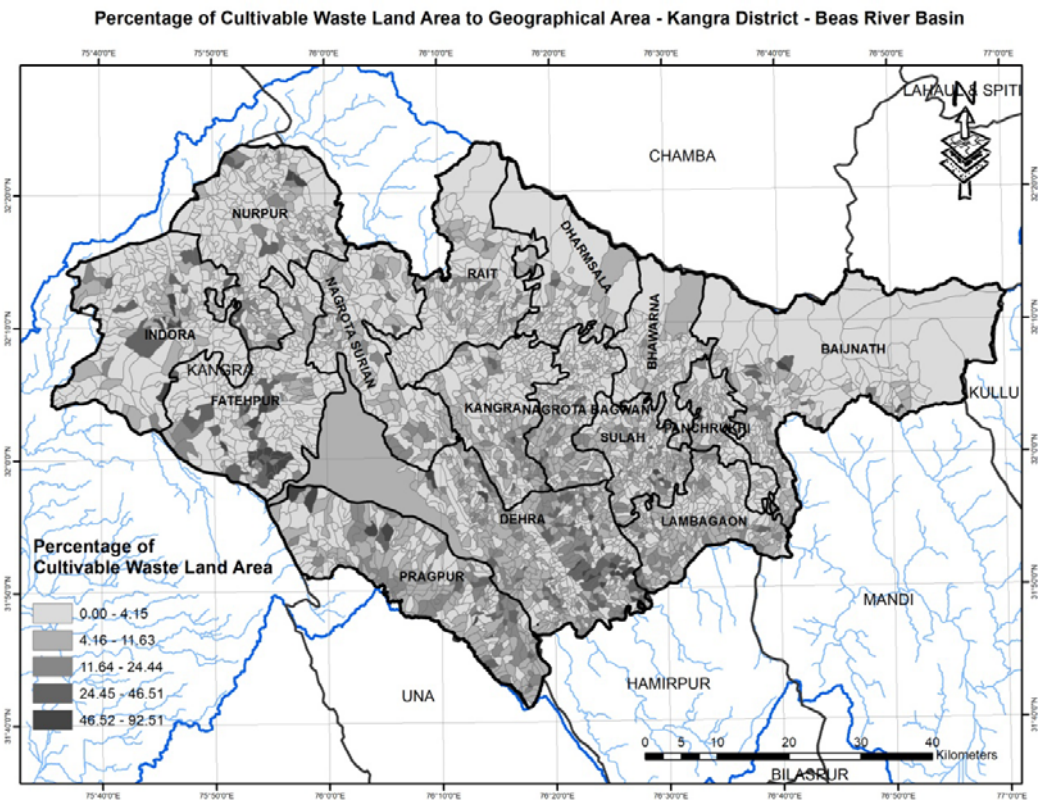
Map 9.14 Percentage of Un-irrigated Land Area to Geographical area

S06 Percentage of Barren & Un-cultivable Land Area to Geographical area



Map 9.15 Percentage of Barren & Un-cultivable Land Area to Geographical area

S07 Percentage of Cultivable Waste Land Area to Geographical Area



Map 9.16 Percentage of Cultivable Waste Land Area to Geographical Area

9.6 Composite Sensitivity

Sensitivity has been calculated by using normalized values of variables based upon Average Hill Slope, Annual Average Water Yield, Percentage of Net Sown Area to Geographical area Human population density, Percentage of Un-irrigated Land Area to Geographical area, Percentage of Barren & Un-cultivable Land Area to Geographical area, Percentage of Cultivable Waste Land Area to Geographical Area. Since the values are on different scale and units, the normalization of indicators using functional relationship has been done.

Variable Indicator S02 i.e. Average Water Yield has ↓ functional relationship with sensitivity and the normalization is done using the formula, which means the Increase in Water Yield will reduce the vulnerability:

$$y_{ij} = \frac{Max_i\{X_{ij}\} - X_{ij}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

However, for indicator S01 i.e. Average Hill Slope the normalization is done using the formula:

$$x_{ij} = \frac{X_{ij} - Min_i\{X_{ij}\}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

This has been done since the functional relationship of indicator S01 with vulnerability is ↑, which means, the increase in Average Hill Slope will indicate increase the vulnerability.

After calculating the score of variables S01 to S07 the average score is calculated and the Composite Sensitivity is calculated and mapped for all census villages:

Village/ Town Code	Village/ Town Name	Block	Indicators/ Variables							Composite Sensitivity

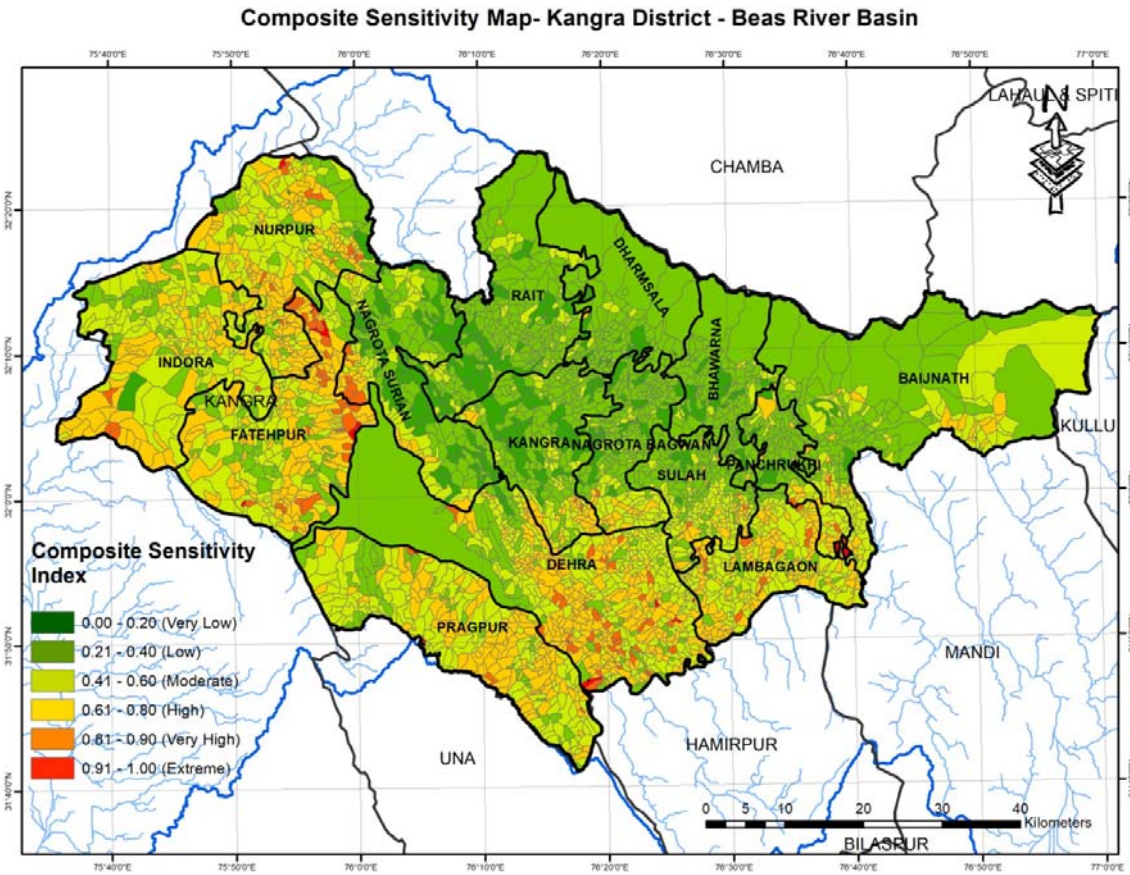

Map 9.17 Village level Composite Sensitivity Map

Map 9.17 depicts that the Sensitivity level of Nurpur, Kangra, Fatehpur, Pragpur, Dehra, Sulah & Lambagaon blocks of District Kangra are higher than other blocks after analysing the indicators; Average Hill Slope, Percentage of Net Sown Area to Geographical area, Human population density, Percentage of Un-irrigated Land Area to Geographical area, Percentage of Barren & Un-cultivable Land Area to Geographical area, Percentage of Cultivable Waste Land Area to Geographical Area & decrease in Annual Average Water Yield.

9.7 Adaptive Capacity Indicators

Based upon sensitivity and exposure, the extent of response to the effects of climate change differs across different regions. For example, frequent drought like conditions could be addressed by one by using appropriate irrigation technology, whereas other one may not be able to afford such technology or may lack the skills to operate it. Therefore, the ability to adapt to certain changes in conditions is very important to determine the vulnerability of a system towards the change. Adaptability, coping ability, stability, management capacity, flexibility, robustness and resilience, all together form the ability of a system to adapt to the changes effectively. Therefore, 'Adaptive capacity' is a significant factor that characterize vulnerability. Adaptive capacity is also defined as the potential or ability of a system, region or community to adjust to the effects or impacts of climate change (IPCC). The adaptive capacity of a system or society is to deal with the changes in conditions to modify its own characteristics and behaviour.

The increase in literacy rate levels enhances the capability of people to access information and cope up with adversities, resulting into reduced vulnerability. The farms with larger agricultural income, land area, farm value assets and latest technology are able to prepare and respond better as compared to the farms with lower, less technology. Also, the farms with traditional technologies are assumed to be less economically diversified and more vulnerable to climatic events. The availability of facilities like electricity, education, health care, etc. determines the state of poverty in a region. When two different agricultural regions having the same crops and similar climate are compared with each other, the exposure to climate changes might be similar, but the adaptive capacity and vulnerability could be very different based on the socio-economic factors. In addition to identification of threat, the analysis of vulnerability also involves resilience or responsiveness of the system and its ability to exploit opportunities and recover from the environmental and climatic changes. Therefore, asset ownership goes hand in hand with vulnerability. The people having more assets are less vulnerable to climate change and on the other hand the people with less areas are more prone to climate change vulnerability.

In present case we have used eleven variables/ indicators to calculate adaptive capacity. The indicators for adaptive capacity are computed using 2011 census data. The maps have been developed for each of these indicators under adaptive capacity. The indicator-wise analysis with functional relationship is as under:

Code	Adaptive Capacity	Units	Years	Functional Relationship with Adaptive Capacity	Data Source
A01	Educational Institutes	Number	2011	↑	Census 2011
A02	Health Institutes	Number	2011	↑	Census 2011

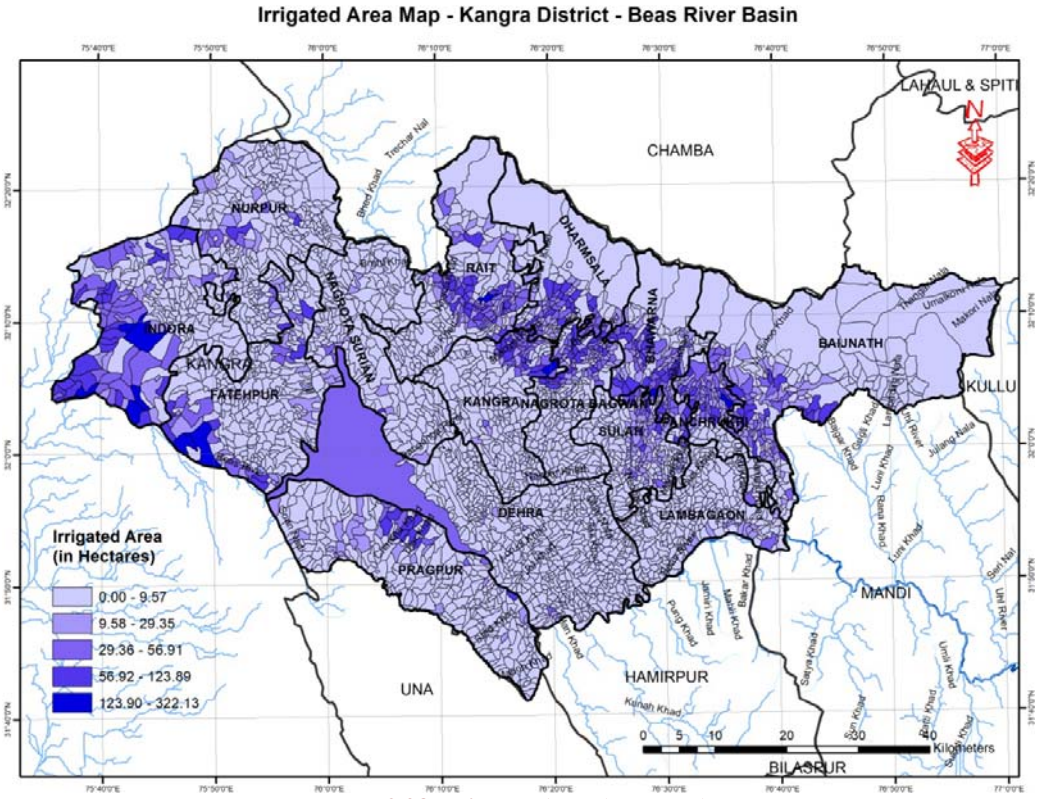
A11 Irrigated Area



Map 9.28 Irrigated Area (Hectares)

9.8 Composite Adaptive Capacity

Adaptive Capacity has been calculated using normalization of values of 11 variables viz. Educational Institutes, Health Institutes, Road Network, Agricultural Credit Societies, Self Help Group, Mandis/Regular Market, Agricultural Marketing Society, Hand Pump, Spring Source, Tank/Pond/Lake, Irrigated Area. Since the values are of different scale and units the normalization of indicators using functional relationship is done.

Variable Indicator A11 i.e. Irrigated Area has ↑ functional relationship with adaptive capacity and the normalization is done using the formula, which means the increase in Irrigated Area will increase the Adaptive Capacity resulting reduction in climate change vulnerability:

$$x_{ij} = \frac{X_{ij} - Min_i \{X_{ij}\}}{Max_i\{X_{ij}\} - Min_i\{X_{ij}\}}$$

After calculating the score of variables A01 to A11 the average score is calculated and the Composite Adaptive Capacity is calculated and mapped for all census villages:

Village Code	Village/ Town Name	Block	Indicators/ Variables											CompAC

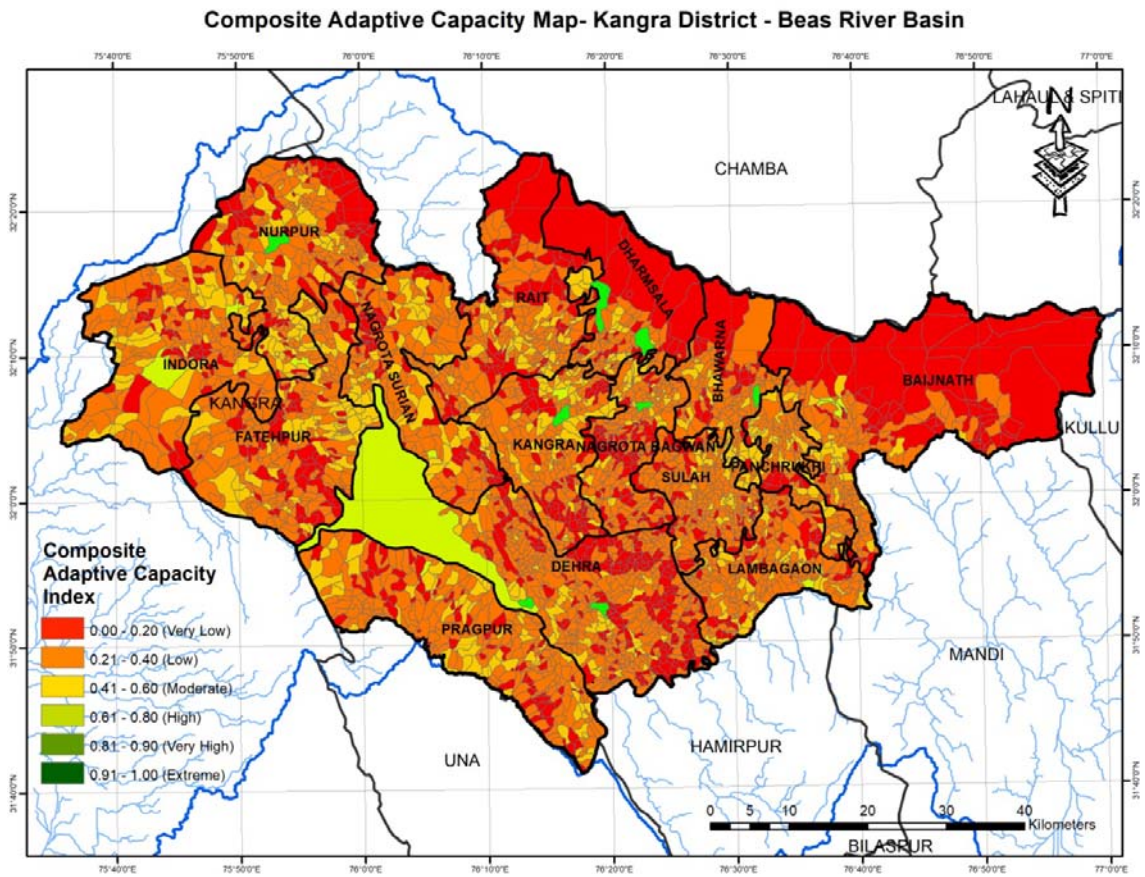

Map 9.29 Village wise Composite Adaptive Capacity

Map 9.29 depicts that the adaptive capacity almost all the villages of blocks of Kangra district is poor/low. The main reason of the low adaptive capacity is less number of Irrigation facilities, less number of Educational Institutes, Health Institutes, Road Network, Agricultural Credit Societies, Self Help Group, Mandis/Regular Market, Agricultural Marketing Society, Hand Pump, Spring Source, Tank/Pond/Lake etc.

9.9 Composite Vulnerability

Once the weight of each indicator is determined, exposure, sensitivity and adaptive capacity maps have been prepared by taking weighted some of the rank of all relevant indicators. These three components and maps along with their functional relationship with vulnerability resulted in the final calculation of vulnerability map varying from 1 to 6 (very low, low, moderate, high, very high and extreme). The composite vulnerability rating maps have been generated using quantum GIS software.

The composite vulnerability rating is arrived at by combining the exposure, sensitivity and adaptive capacity using their respective weights using following formula:

Composite Vulnerability= (Exposure + Sensitivity- Adaptive Capacity)

The study is taken one step ahead towards determining vulnerability for all the villages separately. The vulnerability index was normalized on 0 to 1 scale for all the villages of each Block in study area and then the maps were prepared showing normalized vulnerability for each census village. The normalized vulnerability index has been computed using following formula:

$$\text{Normalized Vulnerability} = (X-X_{min})/(X_{max}-X_{min})$$

where, X is the value of vulnerability index of the villages, X_{min} is the minimum vulnerability of the villages, X_{max} is the maximum vulnerability index of the villages. The following table shows the vulnerability calculated for each census village of the fifteen developmental blocks of the the district Kangra falling in Beas River Basin:

Village/ Town Code	Village/ Town Name	Block	Exposure (E)	Sensitivity (S)	Adaptive Capacity (AC)	Vulnerability Index (0-1)
011447	Anirudh	Baijnath	0.50	0.48	0.11	0.64

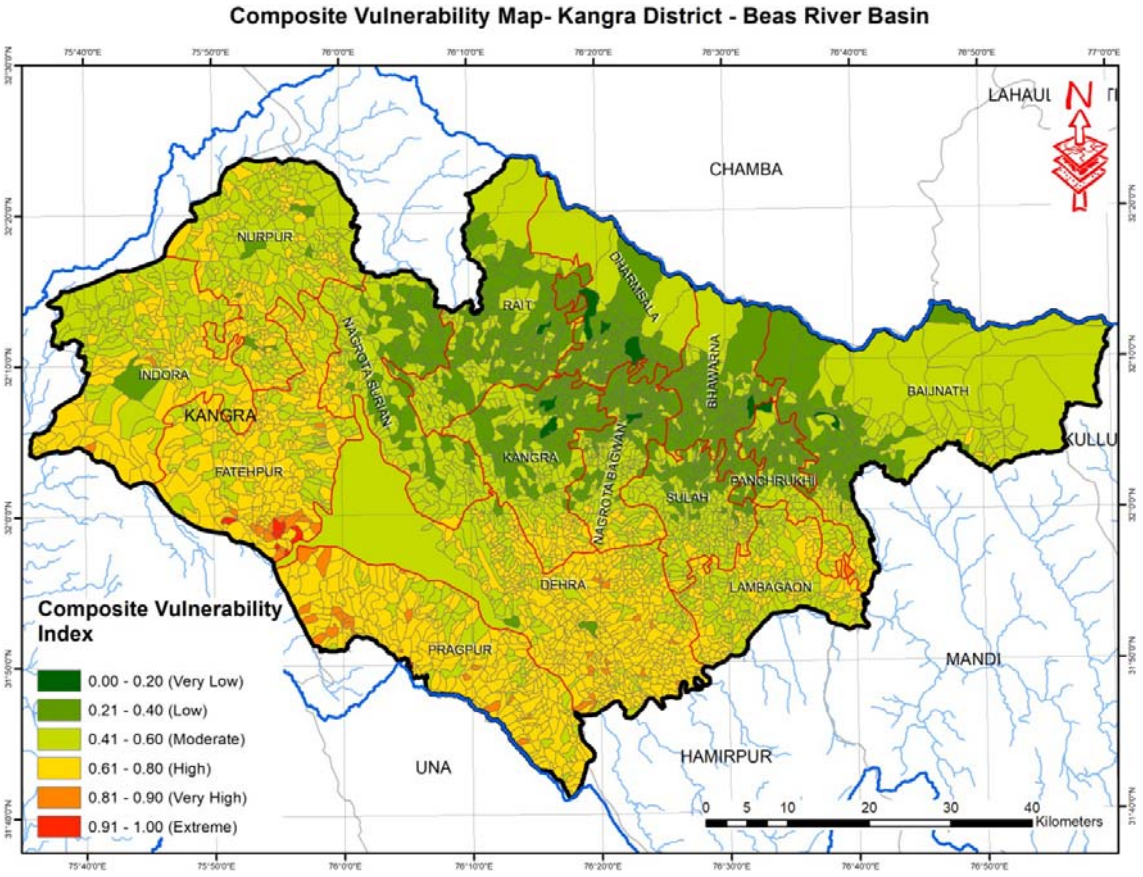

Map 9.30 Village level Vulnerability Map

Vulnerability Map 9.30 shows the village level vulnerability. For better understanding the vulnerability is grouped in 1-6 levels with specific range assigned to each level. Very low vulnerability range has been fixed between 0.00-0.20, low vulnerability range has been fixed between 0.21-0.40, moderate vulnerability range has been fixed between 0.41-0.60, high vulnerability range has been fixed between 0.61-0.80, very high vulnerability range has been fixed between 0.81-0.90 and 0.91-1.00 range has been fixed for extreme vulnerability. Vulnerability map depicts that the climate change vulnerability of the Pragpur, Dehra, Kangra, Labagaon, Fatehpur, Indora, Nurpur Block is high as compare to the other Blocks of Kangra District. The major reasons of this high vulnerability is less adaptive capacity and high exposure & sensitivity levels to the changing climate.

Further the vulnerability maps have also been generated separately for each blocks of district Kangra along with the categorization of the villages vulnerable to the changing climate in 6 different levels (Extreme, Very High, High, Moderate, Low & Very Low).

As depicted above, all villages of fifteen developmental blocks of district Kangra falling in Beas River Basin have been placed according to their corresponding vulnerability levels Extreme, Very High, High, Moderate Low & Very Low. An adaptation plan/ framework needs to be evolved in order to reduce climate change vulnerability of these villages falling in Extreme, Very High & High levels of vulnerability.

10

Analysis Report - Conclusions

10 Analysis Report - Conclusions

The task wise outcomes are given as follows:

10.1 Summary of Vulnerability Assessment at Village level

After detailed analysis of the study area using hydrological and climate change modelling we have been able to determine and identify those villages, which are vulnerable to the climate change. It is evident that change in climate is definitely going to have an impact on agriculture, horticulture, forests and water resources of vulnerable areas. Therefore, in order to reduce vulnerability there is an urgent need to apply clear-cut strategies to cope with the climate change vulnerability in these sectors both long term as well as short term.

The agriculture & horticulture is critical for food, nutritional and livelihood security of people of the district. The district Kangra has made significant progress during the few decades or so and has become a self-sufficient district by producing various cash crops mainly fruits & vegetables. However, with passage of time, it is presently facing several challenges like increase in temperature, un even distribution of rainfall, climate change induced diseases, stagnation in net sown area, decrease in crop yield, deterioration of soil quality, reduction in per capita land availability etc. are emerging issues.

The Forests are also playing very important role in determining the accumulation of greenhouse gases in the atmosphere; they absorb 2.6 billion tonnes of carbon dioxide each year, about one-third of the carbon dioxide released from the burning of fossil fuels. However, this great storage system also means that when forests are cut down, the impact is big. Deforestation accounts for nearly 20% of all greenhouse gas emissions — more than the world's entire transport sector. At the same time, the GHG's off setting capacity of forests is decreased as forests either illegally cut or lost gradually or not quality forests. With the increase of temperature especially in summer season the district encounters more forest fire insidences.

Forests are important for reducing impacts of climate change both present and future effects on people. For example, forest goods tend to be more climate-resilient than traditional agriculture crops and so when disasters strike or crops fail, forests act as safety nets protecting communities from losing all sources of food and income. They also regulate waterways; protect soil, temperature for an entire regions, and more.

There is a need to analyse how forest management can be improved and grow tree cover to benefit the environment and livelihoods. Our research needs to consider everything from REDD+ implementation to land-use change and wetland carbon stores, all of which contribute to our goals of effective climate change mitigation and adaptation.

In case earth's temperature continues to rise, one can expect a significant impact on our fresh water supplies regime with the potential for devastating effects on these resources. As temperatures increase, evaporation increases, sometimes resulting in droughts. In addition, rising temperatures are melting glacial ice at an unprecedented rate and are noted in this region unpresidently. Glaciers are an important source of freshwater and some are under critical threat of disappearing within the 21st century. Areas that previously depended on glaciers for freshwater will then have to seek other sources i.e. entire river system in beas basin will be affected. The relationship between climate change and water doesn't end there.

After consulting district administeration, stakeholder departments/organization the problems of drying up of hand pumps have been reported especially in summer season. The reason behind is ofcourse level water table which is gradually going down.

The adaptation to climate change has the potential to reduce many of its adverse impacts and can lead to enhanced benefits. The key features of climate change vulnerability and adaptation

are related to variability and extremes i.e. risks & hazards. The limited economic resources, information and skills, poor infrastructure and insufficient levels of technology makes the blocks inadequate to adapt and highly vulnerable. Increase in adaptive capacity is necessary for reducing vulnerability to climate changes, encountered in the frequency and intensity of extreme events, like floods and droughts which have sever impacts on agriculture and livelihood of local community.

The villages of the six developmental blocks vulnerable to climate change, need intervention at policy plan and programme level with higher priority. The results are useful for stakeholders such as farmers, policy makers and technical advisors, the scientific community and traders for targeting financial resources and better management of resources towards adaptive capacity with village level analysis. The most of the areas of Beas River Basin falling in Hamirpur District observed to be quite vulnerable to climate change. In the villages/panchayats which are highly vulnerable, policy makers are required to take immediate measures to support effective management of environmental resources (e.g., soil, vegetation and water resources); promote increased market participation, especially within the large subsistence farming sector; stimulate both agricultural intensification and diversification of livelihoods away from agriculture practices; and introduce social programs and including on health, education and welfare, which can help in maintaining and augmenting both physical and intangible human capital.

Investment is required for developing infrastructure in rural areas, and in highly exposed regions, priority is required to be accorded to the development of more accurate systems for early warning of extreme climatic events (e.g., drought or flood) apart from appropriate relief programs and financial inclusion programmes are required for both agri-horti sectors. In addition to the usefulness of the study for policy makers and stakeholders, the study is expected to act as a baseline to further improve the methodologies for assessing vulnerability of agriculture to climate change.

10.2 Vulnerability & Potential for Adaptation:

The most important factor for agriculture/ horticulture, forests & water resources is timely availability of rain and irrigation facilities. The farmers of the Hamirpur district are mostly dependent on the rain for irrigation of farms. People residing along the banks of Beas River Basin somehow manage to irrigate their farms but farmers residing on higher altitude are dependent of rain only there is no option except rain. During summer it gets very sever, when all the natural water resources dries up. Due to the tough geographical condition, it is difficult to connect all the villages with irrigation schemes besides economic reasons.

So far as the government schemes for irrigation are concerned they are not at present available to the all farmers in the region. There are villages where the irrigation schemes were initiated but these are functional as on date and are pending for one or the other reason. While consultation with district administration and community it has been noticed/ informed that the most of the hand pumps installed in Hamirpur district are drying up. The water table is going down with the passage of time.

The State Government is implementing various schemes in order to improve agricultural, horticultural production, increasing forest cover and water resource management in sustainable manner various watershed programmes are being run for local communities. Proper implementation of these schemes in the district could help the farmers manage the adverse impacts of climate change and in reduction of climate change vulnerability while improving adaptive capacity of farmers. These schemes should be implemented across all sectors, regions for maximum coverage horizontally and vertically.

10.3 Indicative Priority Area/ Sector Climate Change Adaptation-Measures to Reduce Vulnerability:

10.3.1 Possible Strategies for Climate Change Adaptation – Water Sector

- Planning, development and management of water resources need to be governed by common integrated perspective considering local, regional, State and national context, having an environmentally sound basis, keeping in view the human, social and economic needs.
- Principle of equity and social justice must inform use and allocation of water.
- Good governance through transparent informed decision making is crucial to the objectives of equity, social justice and sustainability. Meaningful intensive participation, transparency and accountability should guide decision making and regulation of water resources.
- Water needs to be managed as a common pool community resource held, by the state, under public trust doctrine to achieve food security, support livelihood, and ensure equitable and sustainable development for all.
- Water is essential for sustenance of eco-system, and therefore, minimum ecological needs should be given due consideration and priority.
- Safe Water for drinking and sanitation should be considered as pre-emptive needs, followed by high priority allocation for other basic domestic needs (including needs of animals), achieving food security, supporting sustenance agriculture and minimum eco-system needs. Available water, after meeting the above needs, should be allocated in a manner to promote its conservation and efficient use.
- All the elements of the water cycle, i.e., evapo-transpiration, precipitation, runoff, river, lakes, soil moisture, and ground water, sea, etc., are interdependent and the basic hydrological unit is the river basin, which should be considered as the basic hydrological unit for planning.
- Given the limits on enhancing the availability of utilizable water resources and increased variability in supplies due to climate change, meeting the future needs will depend more on demand management, and hence, this needs to be given priority, especially through (a) evolving an agricultural system which economizes on water use and maximizes value from water, and (b) bringing in maximum efficiency in use of water and avoiding wastages/ spillages.
- The impact of climate change on water resources availability must be factored into water management related decisions. Water using activities need to be regulated keeping in mind the local geo climatic and hydrological situation.
- All data and entire information (except data of sensitive and classified nature) should be placed in public domain.
- The initial projections of the impact of climate change on water resources including the likely changes in the water availability in time and location to be targeted.
- Reassessment of basin wise water availability and demands.
- Empowerment and involvement of Panchayati Raj Institutions, urban local bodies, Water Users' Associations and primary stake holders in management of water resources with focus on water conservation, augmentation and harvesting.
- Promote participatory irrigation management.
- Encourage participation of NGOs in various activities related to water resources management, particularly in planning, capacity building and mass awareness.
- Involve and encourage corporate sector / industries to take up support and promote water conservation, augmentation and preservation within the industry and as part of corporate social responsibility.
- Sensitization of all Panchayat members and their functionaries on water availability.
- Promotion of water efficient techniques and technologies including (a) promotion of micro irrigation techniques such as sprinkler and drip irrigation and (b) expansion of Farmers Participatory Action Research Programme, moisture management techniques.
- Undertake Pilot projects for improvement in water use efficiency.

- Promote Water Regulatory Authorities for ensuring equitable water distribution and rational charges for water facilities.
- Promote mandatory water audit including those for drinking & irrigation.
- Adequate provision for operation & maintenance of water resources projects.
- Incentive through award for water conservation & efficient use of water.
- Incentivize use of efficient irrigation practices and fully utilize the created facilities.
- Guidelines for different uses of water e.g., irrigation, drinking, industrial etc. particularly in context of basin wise situations.

10.3.2 Possible Strategies for Climate Change Adaptation – Agriculture & Horticulture Sector Sector

- In order to increase the production of food grains, emphasis to be laid on distribution of seeds of high yielding varieties to the farmers.
- Establishment of Seed Multiplication Farms from where foundation seed to be distributed to registered farmers.
- In order to increase the production of crops, adoption of plant protection measures is of paramount importance. During each season, campaigns to be organised to fight the menace of crop disease, insects and pest etc.
- In order to maintain the fertility of the soil during each season, soil samples to be collected from the farmers field and analysed in the soil testing laboratories. Soil testing laboratories should be established in all the blocks of the district Hamirpur, where as mobile soil testing vans/labs ply in each panchayat in operation for testing the soil samples at site.
- The organic farming is becoming popular being suitable, environmental friendly and health concern to all concerned. Organic farming is to be promoted in each block in a systematic manner by providing trainings, laying out demonstrations, organizing fairs/ seminars to the farmers.
- Set-up vermi-composting units at every house & financial & technical assistance to the farmers is to be provided.
- Keeping in view the depleting sources of conventional fuel i.e. firewood etc., biogas plants have assumed great importance in the Hamirpur district. To overcome this issue Bio-gas plants needs to be propagated.
- Sustainable use of fertilizer to increase the production to be promoted.
- Crop insurance scheme against crop loss especially due to climate change is to be provided to the farmers through financial inclusion programmes.
- In order to maintain the quality of the seeds and also ensure higher prices of seeds to the growers, Seed certification programme has to be given due emphasis.
- With the objective to safeguard the interest of the farming community the regulated markets established in different parts of the Blocks to be providing useful services to the farmers. A modernised market complex at least in each Block needs to be made functional for marketing of agricultural produce, besides construction of market yards in cluster in different Blocks.
- New farm implements/ machines are to be popularized among the farmers. Testing of new machines be carried out and popularize the small power tillers suited for small land holdings.
- Due to topographical factors the soil is subject to splash sheet and Gully erosion resulting into degradation of the soil. Besides this there is biotic pressure on the land. To curb this menace particularly on the Agriculture lands effective soil and water conservation programme should be implemented.
- Water conservation and minor irrigation programme to be accorded priority in order to boost agriculture production.
- Harvesting of rain water and construction of tanks, ponds, check-dams and storage structures needs to be prioritized. Besides this, optimum use of water by low lifting water devices and efficient irrigation system through sprinklers, drip irrigation are to be popularized in rural areas.
- Establishment of Farmer Product Organizations (FPO) in each block.

- Promote sustainable agriculture practices- adopting organic farming, crop rotation, reducing land degradation and soil conservation.
- Improve land management strategies used to protect the environment, boost productivity, strengthen livelihood and enhance food security among marginal sections of society.

INDICATIVE OPTIONS FOR ADAPTATION AT VILLAGE LEVEL INTERVENTION

Climate Change Adaptation measures to reduce vulnerability of rural areas of identified blocks. The indicative option for improving the adaptive capacity of different blocks based on the selected variable at village level is listed in following table:

Adaptive Capacity Indicators		Possible intervention- Adaptation Options					
ID	**Indicator Description**	**Extreme (0 .90-1.00)**	**Very High (0.80-0.90)**	**High (0.60-0.80)**	**Moderate (0.40-0.60)**	**Low (0.20-0.40)**	**Very Low (0-0.20)**

10.4 Framework to reduce vulnerability to Climate Change

The framework has been developed in accordance with the State Strategy and Climate Change Action Plan, This framework is intended to complement the SAPCC. It is necessary to develop strategies and plans at regional and local level. Efforts are required to identify resource management and economic opportunities that climate change may pose to these areas. This framework may help to position marginal farmers in these areas to take effective early steps to avoid potential consequences of climate change. The purpose of this framework is to:

- Identify likely future climate conditions that pose major risks for livelihood security of the marginal farmers.
- Assess the capacity of state programs to effectively address climate-related risks to marginal farmers, local communities, infrastructure, and natural resources. Identify short-term and low- or no-cost priority actions to mitigate such climate induced risks.
- Provide context and initial direction for additional coordination and planning for future climate conditions.

As per recommendations of SCCAP the state Government has initiated the process to develop strategic framework to address climate change vulnerability assessment including following:

- Determine how climate change will affect local regions.
- Support stakeholder organizations/ institutions and individuals in responding to climate change.
- Transform planning processes to deal with climate change from local level.
- Incorporate the agricultural, public health implications of climate change in to planning process.
- Continue to develop and refine a climate change research agenda for local level planning.

This framework could only act as an initial step; it by no mean completes the work needed to be fully implemented. Considerable work is required, especially in collaboration with local farmers, local governments and federal agencies, to fully address climate risks to region. In order to design the potential adaptation options it is important to indicate and scope the associated risks that may pose threat to the local communities.

The most vulnerable resources in the Beas River Basin

Resource	Drivers of vulnerability	Adaptive capacity
Natural systems		
Human resources	– The obvious impoverishment of most people, especially in rural areas, and the increasing stratification of society. – A deteriorating demographic situation caused by a negative natural increase of the population and the aging of societies against the increase in morbidity and	For its maintenance a radical revision of people residing around the Beas River better social and economic policies is needed.

Resource	Drivers of vulnerability	Adaptive capacity
	mortality. – A decline in the quality of education and its incompatibility with the contemporary needs of society and, above all, the economy. – Public risks associated with extreme events.	
Water resources	– The high probability of exposure to the consequences of climate change and variability because "a river is a product of climate." – Evident increase of variability of the Beas River runoff regime and quantity of flow, which makes more difficult their evaluation and prognosis. – Disastrous ecological conditions of small rivers, often being at risk of extinction, and reduction of their contribution to the basin's water resources. – Deterioration of surface water quality due to water temperature increase, decrease in runoff, and anthropogenic pollution. – Very likely continued decline of groundwater levels due to increased climate aridity, intense water withdrawal, and lack of the monitoring of ground water storage and quality.	Ample enough, with the anticipated maintenance or 15% increase in river flow and in the case of extending the network of water reservoirs, a competent river flow control and strict ensuring a minimum environmental runoff, as well as matching the water use with water resource availability.
Forest resources	– A likely change in species composition and wood species' horizontal and vertical areas; the disappearance of certain species. – A very likely emergence of new diseases and pests. An ongoing unauthorized felling, often caused by high poverty levels.	Intensive afforestation is needed.
Ecosystems and wetlands	– Very likely decrease of biodiversity and the	At present is low, being in essence reduced to autonomous adaptation.

Resource	Drivers of vulnerability	Adaptive capacity
	replacement of primary successions by low-productive secondary ones. – Very likely decrease of natural habitats of indigenous species due to their drying, water quality deterioration at higher temperatures, and alien species invasion. – Likely deficit of water supply due to the priority use of Beas River water by certain "privileged" users, for example, hydropower.	
Branches of economy		
Agriculture	– A very likely increase of aridity; more frequent and intensive droughts and extreme weather phenomena (frost, heavy rains, hail, and rainless periods), especially in the middle and lower parts of the basin. – Almost complete destruction of the previous irrigation system, combined with a shortage in water resources available for irrigation. – Likely deterioration of soil fertility due to a possible increase in soil salinity, water erosion, and landslides. – Likely emergence and invasion of new plant pests and animal diseases. – Very likely further depopulation of rural areas and the declining contribution of agriculture to GDP.	Low due to reduced production, rural depopulation and rural-to-urban or abroad migration, and to destruction of large farms. The absence of public subsidies that reduces the competitiveness of domestic products on local and foreign markets and export potential. Reducing the capacity and efficiency of agricultural science.
Water supply and sanitation	– The likely falling of groundwater table and drying up of wells and springs that are main sources of water in rural area. – Lack of proper diversification of water delivery to its users. Likely shortages of available water resources and the	Low if the present economic situation will continue.

Resource	Drivers of vulnerability	Adaptive capacity
	worsening of water quality.	
Fish industry	Likely change in the fish fauna, reduction of its biodiversity, and commercial fish catches due to the disappearance or reduction of spawning grounds.	Medium in the case of the strict control of fishing and spring water releases for spawning fish.
Infrastructure	Likely deterioration due to both climate change direct effects (e.g., high summer temperatures or heavy rainfalls) and the lack of material resources to its maintaining.	Low due to the obvious lack of resources for maintenance and improvement.

10.5 Risk assessment encompassing Water & Agriculture sector:

Scoping Climate Risks

Under this assignment the initial tasks were to identify likely changes in block's climate conditions at Panchayat level and that how it has merged for the last ~ 30-40 years. The working team identified and worked on several indicators to identify the climate change vulnerability.

In this framework, these likely changes- vulnerability has been defined as climate risks. As the work team refined the inventory of risks, characterizing the risks to economic systems became more and more difficult. More to the point, very limited information is available on the likely economic effects of climate change in the State. Risks to GoHP's economy that were identified by the work team were really risks to other systems restated in very general economic terms. In other words, climate-related risks to GoHP's economy reflected the economic consequences of risks to natural systems, built and developed systems, public health and safety. In the end, while this framework attempted to include the economic effects of future climate conditions within its scope, there is limited information available to do so with confidence in given time. Further collaboration with economists and organizations outside government is necessary to improve the assessment of the possible or likely economic consequences of climate change on marginal farmers and the State at a whole.

Following climate risks listed below and in the table and the indicative mainstreaming options constitutes the substantive foundation for the adaptation framework. Climate risks have varying degrees of likelihood; that is, not all the identified climate risks are equally likely to occur in District. The risks are listed according to likelihood levels; the three levels of Very likely, Likely, and More likely than not correspond roughly to 90 percent, 66 percent, and 60 percent confidence levels, respectively. In planning for future climate conditions, it will be important to recognize variability and uncertainty in climate risks.

Potential Consequences of Climate Risks

The team compiled a survey of likely consequences for each climate risk. Some of the consequences are summarized below. The summaries are by no means exhaustive, but rather are intended to help identify state responsibilities and programs that will likely need to prepare for and adapt to the effects of climate change.

Risks Very likely to occur	Risks Likely to occur	Risks More likely than not to occur
Increase in average annual temperatures and likelihood of extreme events. Overall, increased average temperatures will result in increased water temperatures and reduced flows in streams, which over the long term will cause shifts in aquatic habitats, species, and communities. There is serious risk that increased average air temperatures will affect water temperatures and aquatic habitats to the extent that important native species will go extinct. In main plain region low altitude areas hot air will result in increased deaths and illness among vulnerable human populations. The elderly, infants, chronically ill, low income communities, and outdoor workers are the main groups threatened by high temperatures. Higher temperatures increase the threat of human illness from both waterborne diseases and vector borne illnesses. In addition, heat waves, drought and changes in hydrology will contribute to an increase in the threat of wildfire, which will result in increased exposure of vulnerable groups, including marginal farmers. In creased temperature will lead to shift in cropping pattern, change in seed quality, with negative change in soil quality living adverse impacts on marginal farmers. **Changes in hydrology and water supply; reduced snowpack and water availability in some basins; changes in water quality and timing of water availability** Changes in hydrologic patterns in major river basin i.e. Beas river basin which comprises of ~ 70 % area under study with some micro watersheds will	**Loss of wetland, water bodies ecosystems and services** Water bodies and Wetlands play key roles in major ecological processes and provide a number of essential ecosystem services, such as flood reduction, groundwater recharge, pollution control, recreational opportunities, and fish and wildlife habitat, including for endangered species. As such, increases in air temperature and changes in hydrology will exacerbate impacts to already degraded and fragmented wetland and other water bodies- ecosystems. The consequences for losing water bodies, wetland ecosystems and their associated services will potentially affect all systems—natural, built and developed systems, public health and safety, and local economy. Examples of the effects of a loss or reduction in water bodies, wetland ecosystem services include increased flood damage to agricultural lands, and roads; increased requirement of new and expanded drinking water treatment facilities; and increased need for water storage facilities for flood control and to meet seasonal water demand. The loss of wetland ecosystems and services will have indirect consequences on a range of economic activities. Loss of water bodies that provide habitats can eventually reduce the soil quality, fertility. Loss of seasonal wetlands and water bodies will impact waterfowl and shorebird populations. Loss of wetland that provide flood protection may result in higher damage costs as a result of increased flood related damages. Loss of wetland,	**Increased frequency of extreme precipitation events and incidence and magnitude of damaging floods** Extreme precipitation events have the potential to cause localized flooding due partly to inadequate capacity of storm drain systems. Extreme events can damage or cause failure of even dams. Increased incidence and magnitude of flood events will increase damage to property and infrastructure, and will increase the vulnerability of areas that already experience soil changes. Areas thought to be outside the floodplain may experience flooding. Many of these areas have improvements that are not insured against flood damage, and thus floods will probably result in catastrophic property damage and losses. Finally, increased flooding will disrupt ecosystems, thereby affecting the distribution of water, agriculture, and essential services. **Increased incidence of landslides** Increased landslides will cause increased damage to property and infrastructure, and will disrupt transportation and the distribution of water, agriculture, and essential eco services. Widespread damaging landslides that accompany intense rainstorms and related floods occur during spring seasons, monsoon season. Particularly high-consequence events occur about every decade as reported in SCCAP.

affect supplies of water for all uses, and will contribute to increased water quality problems. Reduced availability of water will affect marginal irrigators, changed water supply planning in many micro watersheds, and affect the quality and availability of water for some public drinking water systems as well. Proposals for surface water storage may increase. Changes in the timing and quality of available water will affect aquatic, wetland, and riparian ecosystems and species, especially species that need adequate water in stream to survive and populations that are already identified as threatened or endangered. Hydrologic changes will exacerbate temperature-related water quality problems. Water users suffering the most adverse consequences will be the marginal farmers- irrigators. Irrigated agriculture is a primary economic driver in Hamirpur districts so without careful planning for the consequences of climate change, the agricultural economy may suffer significantly. Changes in hydrology have the potential to significantly affect agricultural productivity until crops suited to new hydrologic conditions are developed.	water bodies that purify water may result in the need for expanded or additional drinking water treatment facilities. Loss of wetland, water bodies that provide water storage may result in the need for the construction of expanded and additional infrastructure to prevent flooding and to meet summer time water demands. **Increase in stream temperatures, with potential for changes in rivulets chemistry** Higher temperature of water bodies will have a negative effect on some local native species and could result in dramatic changes in local ecosystems. Changes in temperature and upwelling may be positive for some species and negative for others off. If there are large increases in temperatures, there is a potential for significant restructuring of the ecological communities on the rivers basin. Population variation of many local species is likely to increase due to direct biological effects of climate change and indirect cascading ecological effects. **Increased incidence of drought** Longer and drier growing seasons and drought will result in increased demand on ground water resources and increased consumption of water for irrigation, which will have potential consequences for natural systems. Droughts affect wetlands, stream systems, and aquatic habitats. Drought will result in drier forests and increase likelihood of forest fires. Droughts will cause significant economic damage to the agriculture industry through reduced yields and quality of some crops. Droughts can increase irrigation-related water consumption, and thus increase	

	irrigation costs. Drought conditions can also have a significant effect on the supply of drinking water. **Increased soil erosion and risk of inundation from increasing levels due to rain intensity and increasing storm intensity** Increased storm, and high rain intensity levels can lead to loss of natural buffering functions of land scapes, wetlands. Accelerating soil erosion has been observed, and may require increased applications of check dams, protective structures. Soil alterations typically reduce the fertility, chocking of wetlands, and dune to adjust to new conditions. Increasing temperatures, dry conditions will increase soil erosion and likely increase damage to irrigated lands, agricultural lands and infrastructure situated on river banks. Soil erosion and the common response to reduce soil erosion can lead to long-term loss of natural buffering functions of irrigated lands and micro watersheds. Applications for soil alteration permits to protect property and such infrastructure are increasing, but in the long term they may reduce the ability of micro watershed systems to adjust to new conditions. **Changes in abundance and geographical distributions of plant species and habitats for aquatic and terrestrial wildlife** Changes in temperature and precipitation regimes will result in a gradual migration of some species and habitats north and to higher elevations. Species that cannot migrate or shift their range quickly enough to respond to climate change, or that have specific life-history needs that cannot be met through migration, will likely experience a decline in	

	population numbers, potentially leading to extinction. Changes in temperatures and hydrology will affect aquatic, wetland, and riparian ecosystems and species, especially species or population units that are already identified as threatened or endangered. Risk of damage by insect and plant pests, which can result in significant damage to native species and communities, will increase with warmer temperatures. Alterations to the species composition of native ecosystems will likely result in a decline in important ecosystem services, including water quality and quantity, carbon storage, soil stabilization, flood control, and nutrient cycling. **Increase in diseases, invasive species and insect, animal and plant pests** Invasive species can negatively impact native plants, fish, and wildlife in agricultural ecosystems by displacing native species, changing habitat characteristics, consuming significant amounts of water, and changing fire regimes. Invasive species have already caused damage forests, grasslands, and wetlands, and agricultural economy. Spread of infectious diseases in the some of micro watershed is occurring, with increased vulnerability to local ecosystems to existing and emerging conditions. **Increase in wildfire frequency and intensity** Increased temperatures, the potential for reduced precipitation in summer months, and accumulation of dry leaves, pine needles in forests due to insect and disease damage (particularly in eastside forests) present high risk for catastrophic fires. An increase in frequency and intensity of	

	forests fire may damage larger areas, and likely cause greater ecosystem and habitat damage. Forests fires may causes crop damages, human health risks due to exposure to smoke etc. Increased risk of forests fire may result in increased potential for economic damage at the urban-forest land interface. Forests fire destroy property, recreational opportunities, and ecosystem services. Some buildings and infrastructure subject to increased fire risk may not be adequately insured against losses due to fire. Increased fire danger will increase the cost to prevent, prepare for, and respond to forests fires.	

Selecting Short-Term Priority Actions

From the above climate risks one can easily look at;

1) The basic capacities of different organizations to address the identified risks; and
2) to compile a list of immediate or short-term actions that may help to improve local capacity to address the risks.

This effort is indicative primarily an initial scoping exercise. There may be many other short-term actions that may be needed to effectively address the identified risks. But given resource and time considerations makes it paramount to limit the list of needed actions to a few relatively low-cost actions. Resources are not indicated to implement any or more than only a few of the needed actions. It thus in turn necessary to identify a limited set of top priority, short-term, low-cost actions from the list. In consultation with nodal department, stakeholders, local agencies, the team prioritized needed actions according to the benefits of each one relative to all the other actions. In selecting priority actions, the team based its assessment on a very general idea of the relative magnitude of the costs and benefits for each of the actions. In attempting to narrow its focus on low cost, high benefit actions, the team assigned high, medium, and low cost and benefit values to each action, relative to the costs and benefits of the other actions, using the following guidelines in the evaluation:

Costs

- Costs to the state: The approximate individual cost to implement the action.
- Costs to major farmers, landowners and growers: Costs to private parties and businesses associations of implementing the action.
- Costs to the public and to particular vulnerable communities, marginal farmers: All other costs to the public, including infrastructure costs and costs to local governments.

Benefits

- Higher priority actions respond to higher likelihood of risks.
- Avoided costs: Reduced losses and damage from climate conditions that will be achieved in a 10-20 year timeframe if the actions are initiated now onwards.

- Higher priority actions address the effects of more than one risks simultaneously.

More time and detailed information about the costs and likely benefits of required actions are necessary to improve the process of identifying priority actions. The present study in given time & resources, preparation of inventory of gaps and actions is by no means exhaustive, nor is it intended to be the last one in identifying climate change adaptation priorities. This framework represents a starting point and initial assessment of State capacity to deal with present and future climate risks at local level. The table as follows lists the short-term priority actions needed to improve local farmer's capacity to address the identified climate risks.

10.6 Climate Risks and Short-Term Priority Actions

Sr. No.		Risk	Action
1.	Very likely to occur	Increase in average annual temperatures and likelihood of extreme events. Hail storms	– Enhance and sustain public health system capacity to prepare for and respond to high temperatures and crop protection measures, pests attacks, air pollution incidences, and improve delivery of information on high temperatures and possible ways to deal with it, especially for isolated and vulnerable populations. – Enhance infrastructural support to marginal farmers on drip irrigations/ precision irrigations. – Provide high quality seeds. – Provide support to marginal farmers to use antihail nets on at least horticulture farming. – Enhance reach of protected cropings.
		Changes in hydrology and water supply; reduced snowpack and water availability in some basins; changes in water quality and timing of water availability	– Maintain the capacity to provide assistance to local farmers to restore water bodies, wetlands, uplands and riparian zones to increase the capacity for natural water storage. – Improve real-time forecasting of water delivery and basin yields to improve management of stored water. – Improve capacity to provide technical assistance and incentives to increase storage capacity and to improve conservation, reuse, and water use efficiency among all consumptive water uses. – Enhance water harvestings in micro watersheds. – Built water storage tanks for marginal communities. – Systematic approach for coping with floods – mapping of areas likely to experience floods, establishing hydraulic and hydrological models and developing comprehensive schemes for flood management and reservoir sedimentation. – Crop diversification among marginal farmers.
2.	Likely to occur	Loss of water bodies, wetland ecosystems and services	– Support implementation of priority actions for Risks 2, 5, 6, 7, and 10 related to hydrologic changes, drought, soil erosion and inundation, habitats, and flooding.

Sr. No.		Risk	Action
		Increase in water bodies temperatures, with potential for changes in water regime/ chemistry and increased pollution loads	– Increase research on the impacts of changes in water temperature and regime/ chemistry river basin, micro watershed habitats and resources. – Promotion of traditional system of water conservation. – Physical sustainability of groundwater resources.
		Increased incidence of drought	– Improve capacity to provide technical assistance and incentives to increase water storage capacity to marginal farmers and to improve conservation, reuse, and water use efficiency among all consumptive water uses. – Comprehensive assessment of ground water to be made. – All over-exploited areas should be covered by recharge of ground water. – Expeditious implementation of water resources projects particularly the multipurpose projects with carry over storages benefitting drought prone and rain deficit areas – Development of guidelines for incentivizing recycling of water including wastewater.
		Increased soil erosion and risk of inundation from increasing levels due to rain intensity and increasing storm intensity	– Inventory and map micro watersheds- irrigated lands that are at risk of soil erosion or inundation, or are barriers to migration, and develop long-term state and local adaptation strategies. – High flooding zonations and potential threat zoning.
		Changes in the abundance and geographical distributions of plant species and habitats for aquatic and terrestrial wildlife	– Identification of ways to manage ecosystems that will improve their resilience to changes in climate conditions. – Local / native species inventory.
		Increase in diseases, invasive species, and insect, animal and plant pests	– Increase monitoring, detection and control measures for pest insects and plant and wildlife diseases. – Increase surveillance and monitoring for climate-sensitive infectious diseases to crops and humans. – Increase outreach and community education about disease and invasive species prevention measures. – Seek new means of securing resources to detect and combat diseases and invasive species.
		Increase in forests fire frequency and intensity	– Include forest fires in planning to reduce vulnerability to natural hazards. – Restore fire-adapted ecosystems to withstand

Sr. No.		Risk	Action
			natural recurring forest fires. – Develop short- and medium-term climate change adaptation strategies for forests and other fire-prone habitats, and improve development standards to reduce exposure to fire risk at the urban-forests land interface. – Improve the capabilities of public health agencies to plan for and respond to the public health and safety risks of forest fire emergencies.
3.	More likely to occur than not	Increased frequency of extreme precipitation events and incidence and magnitude of damaging floods	– Inventory past flood conditions and define and map future flood conditions. – Improve capability to rapidly assess and repair damaged transportation infrastructure, in order to ensure rapid reopening of transportation corridors. – Soil quality checking center development.
		Increased incidence of landslides	– Develop public education and outreach on landslide risks and how to adapt to landslide risks associated with the agriculture.

10.7 Mainstreaming Adaptation- Implementation Framework

Climate variability and change will affect almost 75 % local communities residing in rural areas and nearly every important sector of these three blocks district economy in the coming decades will be under stress. Mounting and maintaining an effective response effort within State government requires coordination and collaboration among local agencies. Given the continuing long-term challenge, climate change and adaptation needs to be 'mainstreamed' in programs and operations.

The local farmers group and the inter departmental working group should be coordinated through effective framework. The District level authorities, as a steering group, should provide oversight for the coordinated implementation of the short-term priority actions and the implementation of recommendations.

Implementing the short-term priority actions shall help local community to make a start on a long-term path for improving community resilience on climate change. Implementing the priority actions initiate the process of factoring information on climate risks in policy and planning at the block, district and state level. But in case implementation of the framework is limited to just the priority actions, several important issues will remain unaddressed. The framework includes a series of recommendations related to these issues, which are not tied exclusively to any one risk.

Sr. No.	Actions	Relevance	Recommendations
1.	Identify Research Needed for Management	Just like all planning efforts, the anticipated future conditions that form the foundation for the framework involve some uncertainty. Further planning for climate change should involve continued identification of needed research to	– Compile an inventory of research needed to improve the effectiveness of adaptation measures at the state and local levels in following prioritized

Sr. No.	Actions	Relevance	Recommendations
		help ensure that measures being considered are the most appropriate measures. In particular, research is needed on the potential economic costs and benefits of alternative adaptation strategies.	areas: 1. Irrigation & Public Health 2. Agriculture 3. Horticulture 4. Forests 5. Soil
2.	Monitoring for Management	Monitoring is an underappreciated element of effective resource management. District or local agencies draw on information from many sources, and may monitor a variety of conditions, to improve local level efficiencies and the management of resources. The foundation of information for managing natural resources and state infrastructure could be improved, however, and such improvements will almost invariably improve local's ability to respond to the effects of future climate conditions.	– Compile an inventory and maps of current surveillance (for crop diseases) and monitoring (for environmental conditions) efforts, and assess the feasibility of integrating different monitoring efforts into a district wide monitoring system. – Monitoring of Crop diversification and traditional seed banking management.
3.	Sectoral Program Assessments	State agencies already have some important capacities to prepare for, respond, and adapt to the effects of future climate conditions. However, the challenge that climate variability and change present to marginal farmers, local communities is that conditions are changing faster than has generally been experienced before. Therefore, it is important that local level policy, program, and permit choices in the future incorporate information about likely future climate conditions, so as to avoid policies that might have clear climate-related future costs.	– State agencies should undertake an initial broad-scale assessment to identify policy and program elements that could result in decisions that place local people, resources or infrastructure at risk such as excessive crop diversification.
4.	Integrating Economic Information into Adaptation Planning	Development of this framework has been somewhat hampered by the absence of reliable information about either 1) the economic costs of projected changes to local climate, especially over time; and 2) the likely cost to effectively respond to such changes, especially at the local level. The framework had to be developed on the basis of the estimated magnitude of costs-of both the effects of climate conditions and	– State Government should work with economists and climate adaptation specialists and existing groups or institutes with expertise in economics to compile plan to analyse the data that can be used to improve the effectiveness of planning for climate

Sr. No.	Actions	Relevance	Recommendations
		actions to address those effects-relative to other effects and actions. It is necessary to improve the economic foundation for future adaptation planning.	variability and change.
5.	Inter-departmental / organizations Coordination	Building resilience to the effects of climate change will require coordination among all levels of government, and should include non-government entities as well. The most effective adaptation strategies will be implemented at the local or regional level, but may well be a function of state or National initiatives. The private and non-profit sectors will also be actively engaged at the local, statewide, and national scale in building resilience in areas such as the economy and social welfare. Activities at all levels will need to be coordinated to assure cost effectiveness and to avoid working at cross-purposes.	– Himachal Pradesh state agencies should consult with National agencies, stakeholders, representatives of local panchayats, and the private and nonprofit sectors to identify ways to coordinate the implementation of climate adaptation initiatives.
6.	Integrating Adaptation and Mitigation Strategies	There is very little in the way of credible scientific challenge to the conclusion that much of the change in climate at the global scale is being driven by increased carbon dioxide emissions from the combustion of fossil fuels. One of the priority overarching actions of an adaptation framework should be to renew the commitment to reducing the generation of greenhouse gasses.	– Assess existing emission reduction strategies to determine how best to incorporate climate change preparedness considerations.
7.	Communications and Outreach	Given the village level exposure to the effects of climate variability and change, the somewhat unpredictable nature of some climate-related events, and the potential to make decisions that increase vulnerability to various effects of climate change, it is critical to increase communications and outreach with the public about preparing for climate change. Communication and outreach efforts to inform local communities about the likely effects of future climate conditions should include information on how individuals and marginal	– Improve ways to ensure effective messaging and outreach to the public related to preparing for climate change.

Sr. No.	Actions	Relevance	Recommendations
		communities can reduce exposure to climate-related risks, and on how individuals can become involved in community-level efforts to prepare for climate change.

Appendices

Appendix-I(a)

Questionnaire for Field Survey

1.	Name of District				
2.	Name of Block				
3.	Name of Panchayat				
4.	Name of Village	Village Code:		Name:	
5.	Details of Information Provider (Preferably Panchayat Representative)	Name & Address: Contact No:			
6.	Average Land Holdings (in Ha.)	Total Land Holding (Ha.) Agricultural Activities (Ha.) Horticultural Activities (Ha.) Other Activities (Ha.)			
7.	District Head Quarter	Name	Distance		
8.	Average Crop Production	Crop Type (Rabi/Kharif) _____ _____ _____ _____ _____ _____ _____ _____ _____	Crop Name _____ _____ _____ _____ _____ _____ _____ _____ _____	Production (Q/Ha.) _____ _____ _____ _____ _____ _____ _____ _____ _____	
9.	Drought History & Impact	**Year**	**Crop Loss** 1. <50% 2. 50 - 75 % 3. > 75%	**Surface Water** 1. Adequate 2. Manageable 3. Poor	**Livestock Death** 1. > Normal 2. Normal 3. <Normal
10.	Schematic Enrolment	**Scheme** *MGNREGA* *Old Age Pension* *Public Distribution System* *Crop Insurance* *Agricultural Credit* *Irrigation Source* *Other (Specify)*		**Enrolment (Yes/No)**	
11.	Local Climate/ Environment (Last 10 years)	**Temperature** *(Increase/ Decrease)*	**Rainfall** *(Increase/ Decrease)*	**Rainfall Shift** *In Time/Late/ Earlier*	
12.	Problems & Coping during Drought	**Problems** *Food Grain Shortage* *Seeds availability* *Scope of employment* *Portable Drinking Water* *Water for livestock* *Water for irrigation*	**Yes/No**	**Coping Strategy**	

		Other (Specify)		
13.	Government support during Drought	**Support**	**Yes/No**	**Benefit availed**
		Debt Relief *Free seeds* *Input subsidy* *Grain support through PDS* *Insurance Premium waiver* *Wage Employment Scope* *Emergency Feeding* *Special Financial Package* *Other (Specify)*		
14.	Farmer Produce Organization	**Available (Yes/No)**	**Name**	**No. of Members**

15.	Details of Association with Self Help Group/ CBOs Other Institutions/ Organization	**No. of Members**	**Type of Product/ Activity**	**Amount Lent (In Rs.)**	**Bank Linkage (Yes/No)**

16.	Infrastructure Facility	**Infrastructure Type**	**Nos.**	**Distance (Mtrs)**
		<u>Storage & Market</u> *Warehouse* *Cold Storage* *Market Yard (Mandi)* *Others (Specify)* <u>Irrigation Infrastructure</u> *Hand Pump* *Natural Spring* *River/Canal (Kulh)* *Lake/Pond/Tank* *Dug Well* *Bore Well* *Lift Irrigation Scheme* *Flow Irrigation Scheme* *Others (Specify)* <u>Drinking Water</u> *Drinking Water Supply Scheme* *Natural Spring* *Other (Specify)* <u>Health Infrastructure</u> *Hospital* *Dispensary* *Primary Health Centre*		

		Community Health Centre *Anganwadi Centre* *Animal Husbandry Hospital* *Others (Specify)* <u>Educational Institution</u> *University* *College* *School* *Technical Institute* *Others (Specify)* <u>Roads</u> *National Highway* *State Highway* *District Road* *Motorable Village Road* *Foot path* *Waterways* *Other (Specify)* <u>Transportation</u> *Railways* *Government Bus Service* *Private Bus Service* *Taxi Service* *Other (Specify)* <u>Sanitation</u> *Public/Community Toilet (Male)* *Public/Community Toilet (Female)* *Toilet in House* *Sewage Treatment Plant* *Biomedical Waste Treatment Plant* *Garbage Collection/ Disposal Plant* *Other (Specify)* <u>Electricity/Energy</u> *Power Supply* *Solar Light* *Other (Specify)* <u>Commutation</u> *Landline Telephone* *Mobile Phone* *Post Office* *Internet Cafes* *Others (Specify)* <u>Broadcasting Service</u> *TV* *Radio* *Others (Specify)* <u>Financial Services</u> *Bank* *Agricultural Credit Societies* *ATMs* *Others (Specify)*		

		Industries *Large Scale Industries* *Small Scale Industries* *Handicrafts* *Handlooms* *Other (Specify)* Other Infrastructure *Public Distribution Service (Shop)* *Field Office (Horticulture Deptt.)* *Field Office (Agriculture Deptt.)* *Field Office (Animal Husbandry Deptt.)* *Agriculture & Horticulture Service Shop* *Seed Shop* *Fertilizer Shop* *Others (Specify)*		

Discussions

Measures taken during drought to save crop?

Paddy:
Wheat:
Pulses:
Vegetables:
Fruits:
Others:

What are the impacts of climate change on crop health?

Sr. No	Disease	Impacts	Measures taken

Awareness on drought proofing measures (put)

Sr. No	**Drought proofing measures**	**Fully aware**	**Have heard but not fully**	**Not aware**
1	Change in cropping pattern			
2	Judicious use of ground water			
3	Water Conservation method			
4	Rain water harvesting			
5	MGNREGA/BRGF/Watershed projects			
6	Govt alert warning on drought			
7	Others (specify)			

What are the problems faced during drought situation?

a. Social:

b. Economic:

C: Livelihood:

What are the measures taken during drought situation (last time)

a. Govt……

b. Own…….

c. NGO/CBO/Others

Is there any migration situation aroused during drought in the village? If yes then discuss it elaborately. Yes

a. How many people migrated during last drought? Approximately
b.
c. Where they have migrated and for how many days?

Women participation in watershed Committee

Total No. of member in the watershed Committee

Total No. of women in the watershed Committee

Whether this watershed committee 1. Functional 2. De-Funct

What do you suggest to tackle the drought situation? (Suggestion of the participants)

Certify that the above information is correct as per the best of my knowledge and experience.
